## INTRODUCTION

The TeamDrive Registration Server Virtual Appliance offers a pre-installed and ready-to-run TeamDrive Registration Server suitable for deployment in a virtualized environment like VMWare.

This document will guide you through the deployment and initial installation of the Virtual Appliance and the configuration of the TeamDrive Registration Server.

This Installation Guide outlines the deployment of a single node installation, where all required components are located on the same OS instance. Please consult the *TeamDrive Registration Server Administration Guide* for recommendations about scalability and/or high availability.

### 3.1 Requirements

#### 3.1.1 Required Skills

When installing the TeamDrive Registration Server, we assume that you have basic knowledge of:

- VMware: importing and deploying virtual machines, configuring virtual networking and storage (when installing the TeamDrive Server components in a virtual environment or when using a pre-installed Virtual Appliance)
- Linux system administration:
  - Adding/configuring software packages
  - Editing configurations files with a text editor (e.g. `vi` or `nano`)
  - Starting/stopping services, enabling them at system bootup time
  - Creating user accounts
  - Assigning file ownerships and privileges
  - Creating and mounting file systems
  - Setting up environment variables
- Apache HTTP Server: installation and configuration, adding and enabling modules, modifying configuration files
- MySQL Database: installation and configuration, administration/maintenance, using the MySQL command line client, basic SQL
- MTA configuration: installing and configuring a local MTA like the Postfix mail server
- Basic knowledge of application server technology

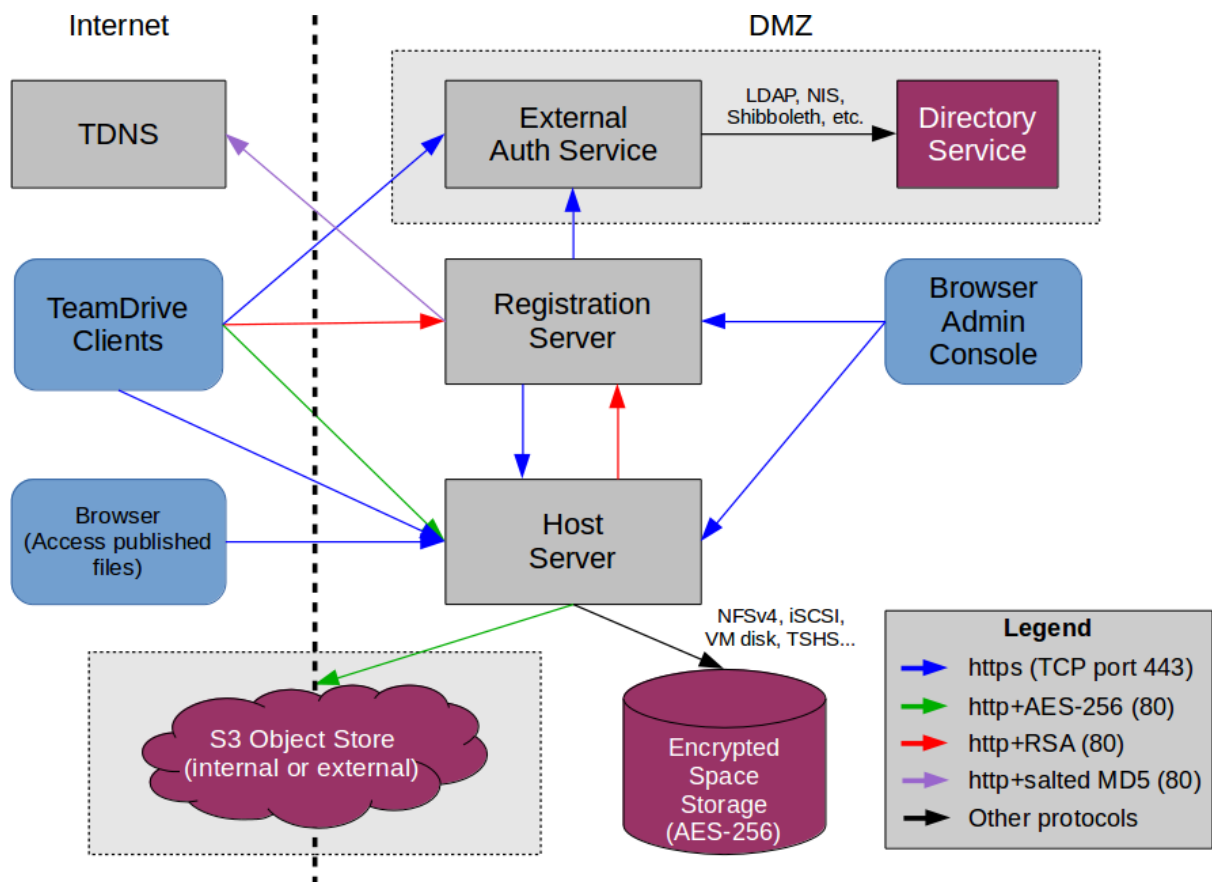

Fig. 3.1: TeamDrive Enterprise Server Networking Overview

### 3.1.2 Network Requirements

The system must have IP connectivity, using a fixed IP address and a resolvable fully qualified domain name. The Registration Server itself needs to be able to properly resolve host names, too.

If the Registration Server is located behind a firewall, please ensure that it is reachable via HTTP (TCP port 80) by the TeamDrive Clients. HTTPS access (TCP port 443) is only required for accessing the web-based Administration Console and can be restricted based on your requirements.

If the Registration Server has been configured to contact the TeamDrive TDNS service, it needs to be able to establish outgoing HTTP connections (TCP port 80) to <http://tdns.teamdrive.net/> and its Master Registration Server (<http://reg.teamdrive.net> by default), either directly or via an existing HTTP proxy server.

For more details about TDNS, see chapter `teamdrive name server (tdns)`.

For the initial registration and the exchange of cryptographic keys, the Host Server must be able to contact the Registration Server via HTTP (TCP port 80). After the registration and activation, no further connections from the Host Server to the Registration Server will be established.

To perform API calls (e.g. to create new Space Depots or to query for existing Spaces for a particular user), the TeamDrive Registration Server must be able to establish outgoing HTTP or HTTPS connections to the TeamDrive Hosting Service.

If you use External Authentication for Authenticating user accounts, the Registration Server needs to be able to establish outgoing HTTP or HTTPS connections to the host providing the external Authentication Service.

## 3.2 Hardware Requirements

The TeamDrive Registration Server Virtual Appliance is delivered in the form of a virtual machine image. Its main technical specifications are:

- Supported platforms: VMWare vSphere 4, 5 or 6 (VMWare Workstation 7 or Oracle VM VirtualBox can be used for testing purposes)
- Minimum VM Memory: 2 GB
- vCPUs: 2
- HDD: 100GB
- Guest OS: CentOS 6/7 (64-bit)

## 3.3 Main Software components

The TeamDrive Registration Server comprises the following components and modules:

- Apache Web Server 2.2 (CentOS 6) or 2.4 (CentOS 7)
- MySQL server (5.1 or later, 5.5 or 5.6 are recommended for better performance)
- PHP 5.6
- Yvva Runtime Environment version 1.4

## VIRTUAL APPLIANCE INSTALLATION AND CONFIGURATION

### 4.1 Download and Verify the Virtual Appliance Image

A .zip Archive containing the virtual appliance's disk image and VM configuration can be obtained from the following URL:

<http://s3download.teamdrive.net/HostServer/TD-Reg-Server-CentOS7-64bit-3.6.8.0.zip>

Download the .zip archive and the corresponding SHA1 checksum file:

<http://s3download.teamdrive.net/HostServer/TD-Reg-Server-CentOS7-64bit-3.6.8.0.zip.sha1>

You should verify the SHA1 checksum to ensure that the zip archive is intact.

You can use the `sha1sum` command line utility on Linux to verify the integrity of the downloaded file.

For guidance on how to verify this checksum on other platforms, see the following articles:

- Apple Mac OS X: [How to verify a SHA-1 digest on Mac OS X](#)
- Microsoft Windows: [Availability and description of the File Checksum Integrity Verifier utility](#)

For additional safety, we recommend to verify the cryptographic signature of the zip archive as well.

You need to have a working GnuPG installation in order to verify this signature. The installation and configuration of GnuPG is out of the scope of this document — see the documentation at <https://gnupg.org/> for details.

The public TeamDrive Build GPG key can be downloaded from here:

<http://repo.teamdrive.net/RPM-GPG-KEY-TeamDrive>

Import the key into your keyring and double check it matches the fingerprint provided below:

```
$ gpg --fingerprint support@teamdrive.net
pub 2048R/9A34C453 2014-07-01
    Key fingerprint = 8F9A 1F36 931D BEFA 693B  9881 ED06 27A9 9A34 C453
uid                               TeamDrive Systems (RPM Build Key) <support@teamdrive.net>
sub 2048R/6048C568 2014-07-01
```

Each official release is signed with this TeamDrive GPG key. The signature can be obtained from the following URL:

<http://s3download.teamdrive.net/HostServer/TD-Host-Server-CentOS6-64bit-3.6.8.0.zip.asc>

To verify the signature on a Linux operating system, the .zip and corresponding .asc file should be located in the same directory. Now run the following command:

```
$ gpg --verify TD-Registration-Server-CentOS6-64bit-3.6.8.0.zip.asc
gpg: Signature made Mo 18 Mai 2015 10:34:09 CEST using RSA key ID 9A34C453
gpg: Good signature from ``TeamDrive Systems (RPM Build Key) <support@teamdrive.net>''
gpg: WARNING: This key is not certified with a trusted signature!
gpg:          There is no indication that the signature belongs to the owner.
Primary key fingerprint: 8F9A 1F36 931D BEFA 693B  9881 ED06 27A9 9A34 C453
```

The procedure on other platforms may vary, please consult the GnuPG documentation for details on how to accomplish this task.

## 4.2 Import the Virtual Appliance

After you have confirmed the integrity and authenticity, unzip the zip archive.

The archive contains four files, a virtual disk image (`.vmdk`), two virtual machine description files (`.ovf`) and a manifest file (`.mf`), containing the file names and SHA1 checksums.

Import the virtual machine image according to the documentation of your virtualization technology and adjust the VM parameters (e.g. number of virtual CPUs, RAM) based on your requirements, if necessary.

---

**Note:** An import to VMWare ESXi might fail with the error:

```
Unsupported hardware family 'virtualbox-2.2'.
```

In this case use the `.ovf` file starting with `vmx_*.ovf`

---

Start up the virtual machine and observe the virtual machine's console output.

## 4.3 First Boot and Initial Configuration

Log in as the `root` user with the standard password `teamdrive`.

To change the default password, type in:

```
[root@localhost ~]# passwd
```

and define your own strong password. To change the network device and DNS, type in:

```
[root@localhost ~]# nmtui
```

A detailed description for the network setup can be found here <http://www.krizna.com/centos/setup-network-centos-7/>

---

**Note:** A cloned CentOS image in a VMWare environment might exhibit problems updating the network interface. If you are observing issues when configuring the network interface, please follow these instructions: [https://wiki.centos.org/TipsAndTricks/VMWare\\_Server](https://wiki.centos.org/TipsAndTricks/VMWare_Server)

---

## 4.4 Updating the Installed Software Packages

As a first step, we strongly advise to perform an update of the installed software packages. New security issues or software bugs might have been discovered and fixed since the time the Virtual Appliance has been built.

This can be done using the `yum` package management tool. As a requirement, the Virtual Appliance needs to be connected to the network and needs to be able to establish outgoing HTTP connections to the remote RPM package repositories. To initiate the update process, enter the following command:

```
[root@regserver ~]# yum update -y
```

`yum` will first gather the list of installed packages and will then determine, if updates are available. If any updates need to be installed, the affected RPM packages will now be downloaded from the remote repositories and installed.

If the yum update installed any updated packages, consider performing a reboot before you proceed, to ensure that the updates are activated.

---

**Note:** Performing a regular update of all installed packages is an essential part of keeping your system secure. You should schedule a regular maintenance window to apply updates using `yum update` (and perform a reboot, to ensure that the system still boots up fine after these updates). Failing to keep up to date with security fixes may result in your system being vulnerable to certain remote exploits or attacks, which can compromise your system's security and integrity.

---

## 4.5 Changing the Default MySQL Database Passwords

The TeamDrive Registration Server Virtual Appliance uses the following default passwords for the MySQL database. We strongly suggest changing the passwords of the MySQL users `root` and `teamdrive` before connecting this system to a public network.

Account type	Username	Password (default)	New Password
MySQL Database Server	root	teamdrive	
MySQL Database Server	teamdrive	teamdrive	

To change the passwords for the MySQL `root` and `teamdrive` user, please use the following commands. First change the password for the root user:

```
[root@regserver ~]# mysqladmin -u root -pteamdrive password
Warning: Using a password on the command line interface can be insecure.
New password: <new password>
Confirm new password: <new password>
```

Next, log into the MySQL database as the `root` user (using the new password) and change the password for the user `teamdrive`:

```
[root@regserver ~]# mysql -u root -p
Enter password: <new password>

[...]

mysql> SET PASSWORD FOR 'teamdrive'@'localhost' = PASSWORD('<new password>');
Query OK, 0 rows affected (0.00 sec)

mysql> quit
Bye
```

---

**Note:** Take note of the new MySQL password for the `teamdrive` user, as you will need to change some configuration files using that password as outlined in the following chapters [Configuring the Registration Server's MySQL configuration](#) and [Administration Console MySQL Configuration](#).

---

## CONFIGURING AND TESTING THE MYSQL DATABASE CONNECTIONS

### 5.1 Configuring the Registration Server's MySQL configuration

If the username, password or host name to connect to the MySQL database server have been changed from the installation defaults, you need to update the login credentials used by the Registration Server's Yvva Runtime Environment.

To change the MySQL login credentials for the Registration Server's database connections, open the file `/etc/td-regserver.my.cnf` in a text editor.

The user field identifies the user name, while the password field contains the MySQL user's password in plain text:

```
#
# This configuration file defines the MySQL login credentials (e.g. username,
# password, host name) used by the TeamDrive Registration Server Apache module
# (mod_yvva), the TeamDrive Registration Server Auto Tasks (service
# td-regserver) and (optionally) the PHP-based TeamDrive Registration Server
# Admin Console. You need to restart httpd and the TeamDrive Registration
# Server background process after making changes to this file.
#

[regdb]
database=td2reg
user=teamdrive
password=teamdrive
host=localhost
socket=/var/lib/mysql/mysql.sock
```

---

**Note:** Please note that this file contains the MySQL login credentials in plain text. Make sure to restrict the access permissions to this file so that only the root user and the Apache HTTP Server (`mod_yvva` in particular) can open this file. The file ownerships should be set to `apache:apache`, the file permissions should be set to `“600”`.

---

After making changes to the credentials, you have to restart the Apache HTTP Server and the `td-regserver` background service.

If you're seeing any errors at this stage, please consult the chapter troubleshooting for guidance. Double check that the MySQL login credentials are correct. Also try to connect to the MySQL database using these values from the `mysql` command line client.

## 5.2 Administration Console MySQL Configuration

In order to being able to manage the Registration Server, the PHP-based Administration Console needs to be able to connect to the Registration Server's MySQL Database.

By default, the Administration Console uses the same configuration file as the Registration Server (`/etc/td-regserver.my.cnf`), so any changes made in this file also apply to the Administration Console, if it's located on the same host as the actual Registration Server.

The location of the MySQL configuration file is specified in the configuration file `/var/www/html/tdlibs/globals.php`. The distribution ships with an example configuration file `/var/www/html/tdlibs/globals-sample.php` — just copy it to `globals.php` and modify it to match your environment:

```
<?php
/*
 * This file specifies how the TeamDrive Registration Server
 * Administration Console connects to the MySQL database.
 *
 * Please change these settings to suit your environment, and then
 * save this file as "globals.php"
 */

/*
 * Specify a path to a local MySQL configuration file (default).
 * If found, these values override any settings provided in $dsn2import
 * below.
 *
 * The file should look as follows (MySQL INI-style format):
 *
 * [regdb]
 * database=td2reg
 * user=teamdrive
 * password=teamdrive
 * host=localhost
 */
$mysqlConfigFile = '/etc/td-regserver.my.cnf';

/*
 * Alternatively, enter the connection string to connect the MySQL database.
 * Use this option if the Admin Console is installed on a separate host and
 * there's no TeamDrive specific MySQL configuration file
 *
 * The format is: mysql://<username>:<password>@<host>/<database>
 */
//$dsn2import = 'mysql://teamdrive:teamdrive@127.0.0.1/td2reg';
?>
```

As an alternative to providing the location of a MySQL configuration file (e.g. when installing the Administration Console on a different host), you can define the username, password and hostname required to connect to the MySQL database server in `globals.php` directly, by commenting out the `$mysqlConfigFile` variable and updating the connection string in the variable `$dsn2import` accordingly:

```
$dsn2import = 'mysql://teamdrive:teamdrive@127.0.0.1/td2reg';
```

The format is `mysql://<username>:<password>@<hostname>/<databasename>`. The database name usually does not need to be modified (`td2reg` is the default name).

The file must be readable by the user that the Apache HTTP Server is running under, usually `apache`, but should otherwise be protected against unauthorized viewing (e.g. by setting the file ownerships to `apache:apache` and the access privileges to `600`).

## REGISTRATION SERVER CONFIGURATION

This chapter will guide you through the initial configuration of the TeamDrive Registration Server.

The web-based setup process will perform the following steps:

- Defining the Registration Server Identity (e.g. Server Type, Server Name, Provider Code)
- Registering the Registration Server with the selected TDNS and Master Registration Server (optional, when selecting the default Server Type “Standard”)
- Setting up the default provider account (e.g. username/password, API and login access, contact details)
- Registration Server SMTP configuration (SMTP server, email addresses)
- Verification of the SMTP configuration

Once this initial setup has been concluded, other configuration aspects of the Registration Server can be modified using the Registration Server’s Administration Console.

If you have any questions about this step, please contact your TeamDrive representative or TeamDrive support via e-mail at [support@teamdrive.net](mailto:support@teamdrive.net).

### 6.1 Start the Apache HTTP Server

Start the Apache HTTP Server to proceed with the Registration Server configuration:

```
[root@regserver ~]# service httpd start
```

**Warning:** At this point, the Registration Server’s web server is answering incoming requests from any web client that can connect to its address. For security purposes, you should not make it accessible from the public Internet until you have concluded the initial configuration, e.g. by blocking external accesses using a firewall.

### 6.2 Start the Web Based Setup Process

From a desktop system that can connect to the Registration Server via HTTPS, start a web browser like Mozilla Firefox, Google Chrome (or any other modern web browser) and start the configuration process by opening the following URL in your browser:

<https://regserver.yourdomain.com/setup/>

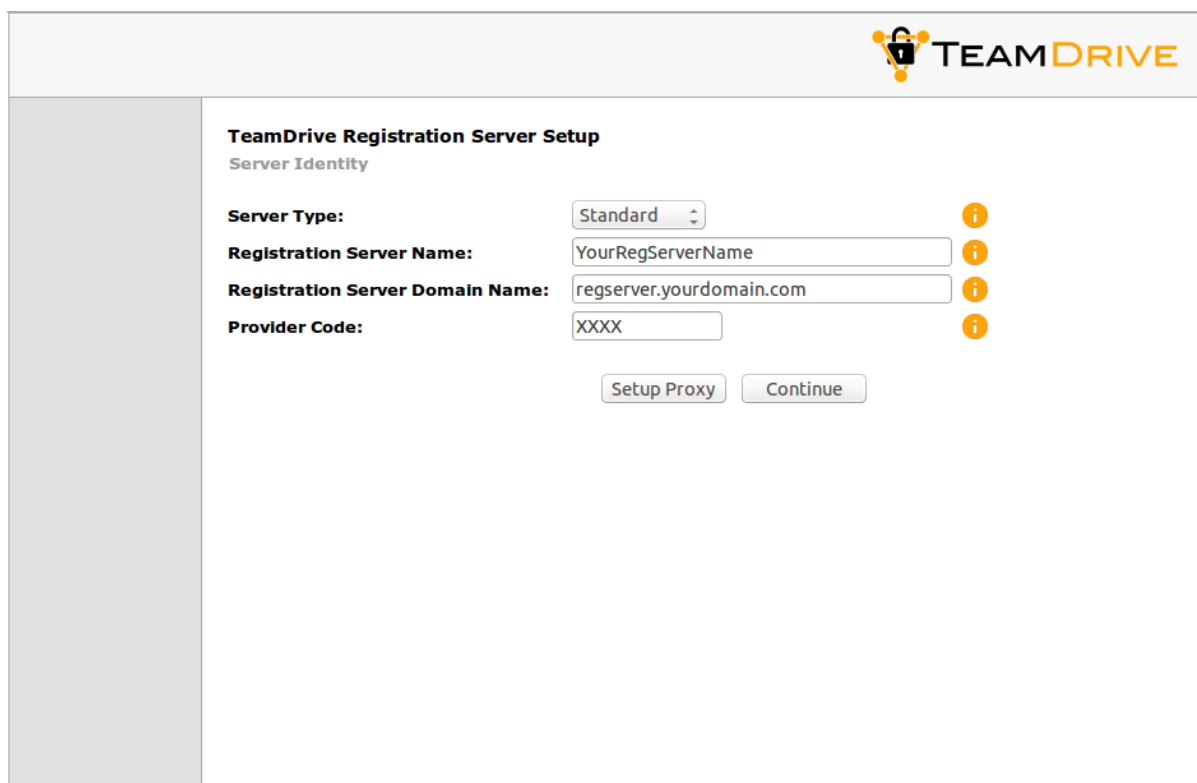

This should open the first Registration Server Setup page. If you get an error message like “500 Internal Server Error”, check the log files for any errors. See chapter web installation 500 internal server error for details.

If you have performed a partial setup of the server before, the process will continue with the next unfinished step.

**Note:** If you haven't replaced the server's self-signed default SSL certificate yet, your web browser most likely will complain about an untrusted/insecure connection. Either replace the SSL certificate with an appropriate one before you proceed, or ignore this message.

## 6.3 Server Identity

The first step is to define the Registration Server's "identity", in particular what type of server you want to set up, the server's name and your Provider Code.

The screenshot shows the 'TeamDrive Registration Server Setup' interface. At the top right is the 'TEAMDRIVE' logo. The main heading is 'TeamDrive Registration Server Setup' with a sub-heading 'Server Identity'. Below this are four configuration fields, each with an information icon (i) to its right:

- Server Type:** A dropdown menu currently set to 'Standard'.
- Registration Server Name:** A text input field containing 'YourRegServerName'.
- Registration Server Domain Name:** A text input field containing 'regserver.yourdomain.com'.
- Provider Code:** A text input field containing 'XXXX'.

At the bottom of the form are two buttons: 'Setup Proxy' and 'Continue'.

Fig. 6.1: Registration Server Setup: Configuring the Registration Server Identity

Enter the following information in the appropriate fields:

**Server Type** Select what type of Registration Server you wish to setup. A **Standard Registration Server** can host one or multiple Providers/tenants and is connected to the TeamDrive Master Registration Server and the TeamDrive Name Service (TDNS). This is the default.

A **Standalone Registration Server** is not connected to a Master Registration Server and/or TDNS.

A **Master Registration Server** is connected to a TeamDrive Name Server (TDNS) and has a number of Standard Registration Servers. If you want to setup a Master Registration Server, you also need to setup your own TDNS instance.

**Note:** Note that a custom TeamDrive Client is required to connect to a Standalone or Master Registration Server.

**Registration Server Name** Enter the name of your Registration Server, e.g. RegServerXXXX (where XXXX is your provider code), or RegServerYourCompany. The name may not include spaces and must be unique for the entire TeamDrive Registration Server Network. A TeamDrive Network consists of a Registration Server, connected to a central Master Registration Server and a TDNS (TeamDrive Name Server). Consult

your TDNS or Master Registration Server Operator if you have questions about selecting an appropriate name here.

**Registration Server Domain Name** Enter the domain name of your Registration Server. This is the domain name of the Apache Web-server that will serve data to the TeamDrive clients and must be resolvable via DNS by the TeamDrive Clients.

---

**Note:** Dont use an **IP address** instead of a domain name, because using an IP address will cause the following problems: Register a SSL certificate for an IP address can be a problem and the TeamDrive client applications on the Apple platform (MAC and IOS) require a valid and official SSL certificate for the HTTPS communication. Apple only allows HTTPS connections. The second problem is, that the IP of the server cant be changed anymore. There is no possibility in the TeamDrive clients to modify the Registration Server URL. If the server will be not longer reachable by the initial name, the clients will not be able to send or recieve invitations and other informations from the Registration Server.

---

**Provider Code** Enter your Provider Code. The Provider Code (aka Distributor Code) is a 4 character code, consisting of letters A-Z and 0-9. The Provider Code must be unique when your Registration Server is connected to TDNS. Contact your TDNS operator (usually TeamDrive Systems), to obtain and/or register your provider code.

### 6.3.1 HTTP Proxy Setup (optional)

When concluding this step, the setup will submit a “ping” HTTP request to verify that the Registration Server is reachable via the provided host name.

If outgoing HTTP requests initiated by the Registration Server are blocked by a firewall and need to be sent via a proxy server, you can configure it by clicking **Setup Proxy**.

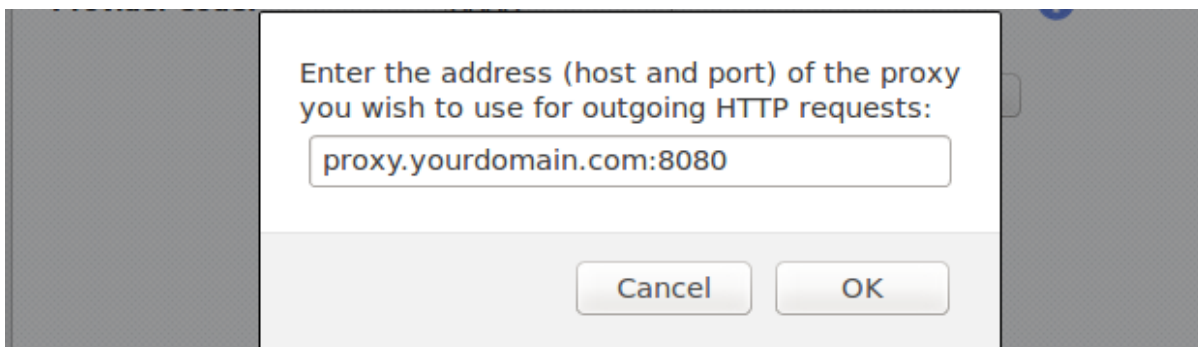

Fig. 6.2: Registration Server Setup: Configuring the HTTP Proxy

In the popup window, enter the proxy’s host name and TCP port, if required.

---

**Note:** Note that the Registration Server currently does not support proxy auto-config (PAC) files, the Web Proxy Autodiscovery Protocol (WPAD) or proxy servers that require some form of authentication.

---

Click **OK** to save the proxy settings, or **Cancel** to abort.

Click **Continue** to proceed to the next step.

## 6.4 Server Registration

This step will register your Registration Server with the TeamDrive Name Service (TDNS) and the Master Registration Server.

For more details about TDNS, see chapter teamdrive name server (tdns).

**Note:** This step will be skipped entirely, if you are setting up a “Standalone” Registration Server, as it does not have to be registered with TDNS or a Master Registration Server.

If you set up a Master Registration Server, only the TDNS-related information needs to be entered.

YourRegServerName

**TEAMDRIVE**

### TeamDrive Registration Server Setup

#### Server Registration

Send the following information to the Administrator of the Master Registration Server. The Administrator will register your Registration Server, and provide you with this information needed to fill in the fields below.

<b>Registration Server Name:</b>	YourRegServerName
<b>Registration Server Domain Name:</b>	regserver.yourdomain.com
<b>Provider Code:</b>	XXXX
<b>Authentication Sequence:</b>	[redacted]

**Master Registration Server Name:**  ⓘ

**Master Registration Server Domain Name:**  ⓘ

**TDNS Host:**  ⓘ

**TDNS Server ID:**  ⓘ

**TDNS Checksum:**  ⓘ

Fig. 6.3: Registration Server Setup: Server Registration

Each Registration Server has a unique “Authorization Sequence” that is required so that Clients can submit invitation messages to users managed on other Registration Servers within the TDNS Network.

Take note of the following information and send it as text, not as an image, to the operator of the Master Registration Server and/or TDNS (usually to TeamDrive Systems via [support@teamdrive.net](mailto:support@teamdrive.net)).

**Registration Server Name** The unique Registration Server name you entered in Step server identity.

**Registration Server Domain Name** Your Registration Server’s resolvable public DNS name.

**Provider Code** Your Provider Code.

**Authentication Sequence** A randomly generated code that is unique for each Registration Server and is used for the authorization of Clients that want to exchange encrypted messages with that Registration Server.

The Administrator will register your Registration Server, and provide you with the information required to fill in the TDNS fields described below.

**Note:** Without the information the standard TeamDrive client could not contact your server. You will find more details about the communication between clients and different Registration Server in the chapter teamdrive name server (tdns).

Enter the following information in the appropriate fields:

**Master Registration Server Name** All Standard Registration Servers must be connected by a Master Registration Server. By default, this is `TeamDriveMaster`.

**Master Registration Server Host** Enter the host name of the Master Registration Server. Setup will attempt to register your Registration Server with the master server running on this host. By default, this is `reg.teamdrive.net`.

**TDNS Host** This is the host name of the TDNS (TeamDrive Name Server). By default, this is `tdns.teamdrive.net`.

**TDNS Server ID** This is an ID allocated by TDNS when the Provider Code is registered on TDNS. You need to obtain it from your TDNS operator.

**TDNS Checksum** This is a unique code which is generated by TDNS when the Provider Code is registered on TDNS. You need to obtain it from your TDNS operator.

---

**Note:** Before proceeding with a Standard Server setup, you must have entered your **TDNS Server ID** and **TDNS Checksum**, which will be provided by your TDNS/Master Registration Server operator (usually by TeamDrive Systems) after you submitted your Registration Server's details as outlined above.

---

### 6.4.1 HTTP Proxy Setup (optional)

When concluding this step, the Registration Server will attempt to send HTTP requests to the TDNS and Master Registration Server, to verify they can be reached via the host names you provided and that the TDNS checksum was entered correctly.

If outgoing HTTP requests need to be sent via a proxy server (and you haven't done so in the first step already), you can configure it by clicking **Setup Proxy**.

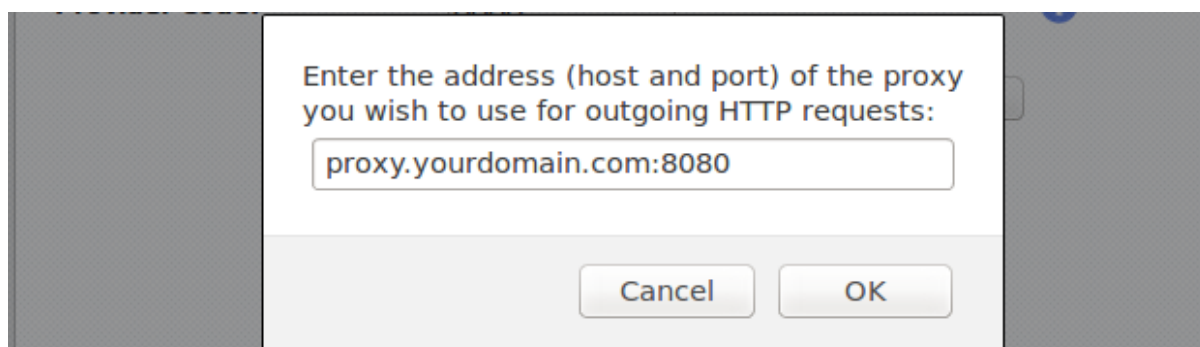

Fig. 6.4: Registration Server Setup: Configuring the HTTP Proxy

In the popup window, enter the proxy's host name and TCP port, if required and click **OK** to save the proxy settings, or **Cancel** to abort.

Click **Continue** to proceed to the next step, or **Back** to return to the previous step.

## 6.5 Provider Setup

In this step, you create the user account associated with your default provider account. This user account has all privileges required to manage all aspects of the Registration Server as well as your and all other future provider accounts hosted on this Registration Server.

Fill in your details as described below.

**Username** The username of the Registration Server administrator used to login to the Administration Console.

**YourRegServerName**

**TeamDrive Registration Server Setup**  
Provider Setup

**Provider Code\*:**  i

**Username\*:**  i

**Password\*:**  Complexity: 24% i

**API Access List\*:**  i

**Admin Login Access List:**  i

**First Name:**  i

**Last Name:**  i

**Email\*:**  i

**Company:**  i

**Telephone:**  i

(\*) These are required fields.

**i API Access List:**  
This is a comma separated list of IP addresses of the hosts that are allowed to access the Registration Server API. You must include the IP address of the host that will be running the Administration Console.

Fig. 6.5: Registration Server Setup: Provider Setup

**Password** Password of the Registration Server administrator used to login to the Administration Console.

**API Access List** This is a comma separated list of IP addresses of the hosts that are allowed to access the Registration Server API. You must include the IP address of the host that will be running the Administration Console.

**Admin Login Access List** This is a comma separated list of IP addresses of the hosts that are allowed to login to the Registration Server Administration Console. This should include the IP address of the browser you are currently using. If the list is empty, access is allowed from any host. This setting is not recommended.

**First Name** The given name of the Registration Server administrator.

**Last Name** The surname of the Registration Server administrator.

**Email Address** Email address of the Registration Server administrator.

**Company Name** The company name of the Registration Server administrator.

**Telephone** Telephone number used to contact the Registration Server administrator.

Click **Continue** to proceed to the next step, or **Back** to return to the previous step.

## 6.6 Email Configuration

The TeamDrive Registration Server needs to be able to send out various notifications (e.g. Space invitations, License modifications) via SMTP.

In this step, you enter the required details about how the Registration Server contacts the MTA and which email addresses should be used for sending out emails. Fill out the fields according to your requirements.

**Note:** The Yvva Runtime Environment that provides the foundation for the Registration Server is only capable of sending out email using plain SMTP via TCP port 25 to a local or remote MTA.

YourRegServerName

**TeamDrive Registration Server Setup**  
Email Configuration

**SMTP Server:**

**Send Timeout (seconds):**

**Sender Email Address:**

**Email Sending Host:**

**Administrator Email:**

Fig. 6.6: Registration Server Setup: Email Configuration

If your mail server requires some form of authentication or transport layer encryption like SSL/TLS, you need to set up a local MTA that relays all outgoing email from the TeamDrive Registration Server to your mail server using the appropriate protocol and credentials. See chapter installing postfix for details.

**SMTP Server** This is the host name (and TCP port) of the SMTP server used to send emails, e.g. `smtp.yourdomain.com:25`. The TCP port number can be omitted, if it's the default port for SMTP (25).

**Send Timeout** The timeout (in seconds) before an email submission to the SMTP server will be aborted, if there is no reply.

**Sender Email Address** This is the email address that will appear as sender in email envelope. Sometimes this address is also used as the "From" email address.

**Email Sending Host** This is the host name of the system that will send the email (aka the HELO host). The value should identify the system sending the email, you should use an externally addressable DNS name for this value (usually the Registration Server's host name).

**Administrator Email** Email address of the Registration Server administrator. This address will be used to send a test email, before the setup can be completed.

Click **Continue** to proceed to the next step, or **Back** to return to the previous step.

## 6.7 Email Confirmation

To test that the SMTP setup is functional, the setup process will send an email to the address you provided as the *Administrator Email* in the previous step.

If you don't receive the email within some minutes, check your mail server's log files (e.g. `/var/log/maillog`) and the sender's email account for errors or bounce messages and adjust the SMTP server configuration accordingly.

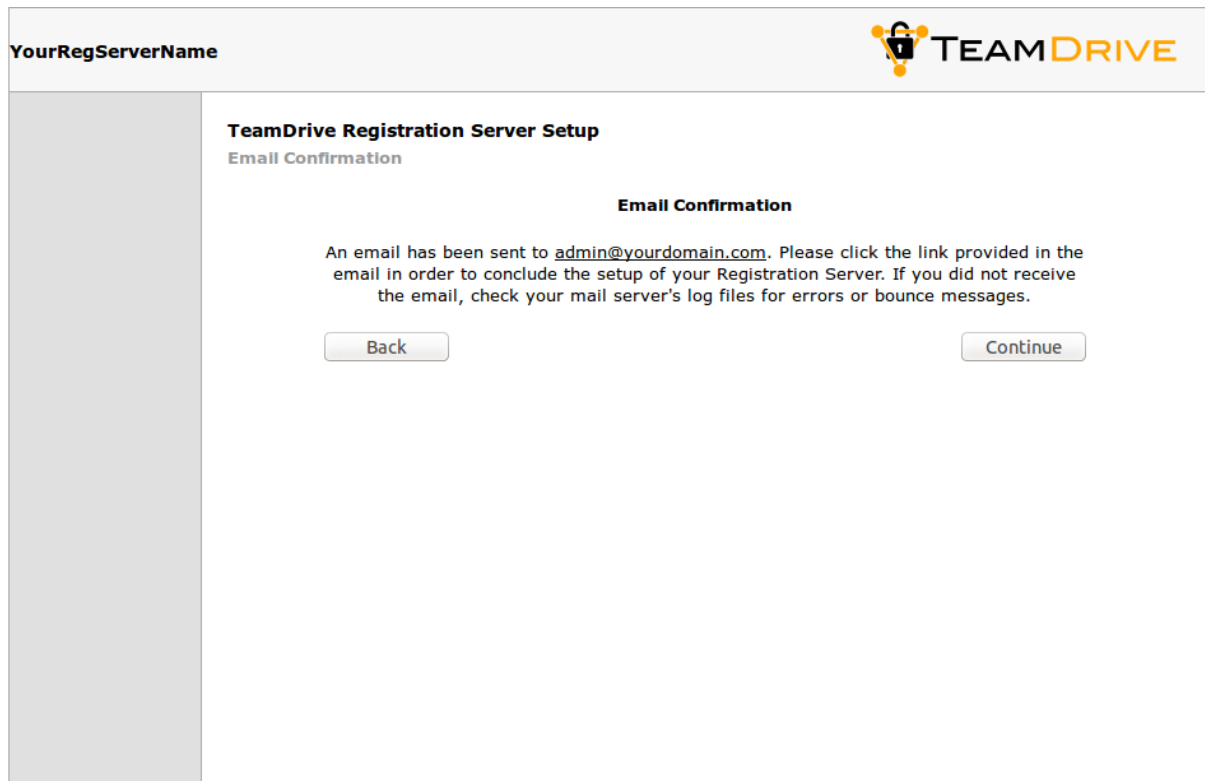

Fig. 6.7: Registration Server Setup: Email Confirmation

If you received the email, the SMTP service for the TeamDrive Registration Server has been configured correctly. Please click the link provided in the email (or copy and paste it into your web browser's address bar) in order to conclude the setup of your Registration Server.

## 6.8 Setup Complete

After you have clicked the confirmation link provided in the email, you will see a confirmation page. At this point, you have completed the initial setup of your Registration Server successfully.

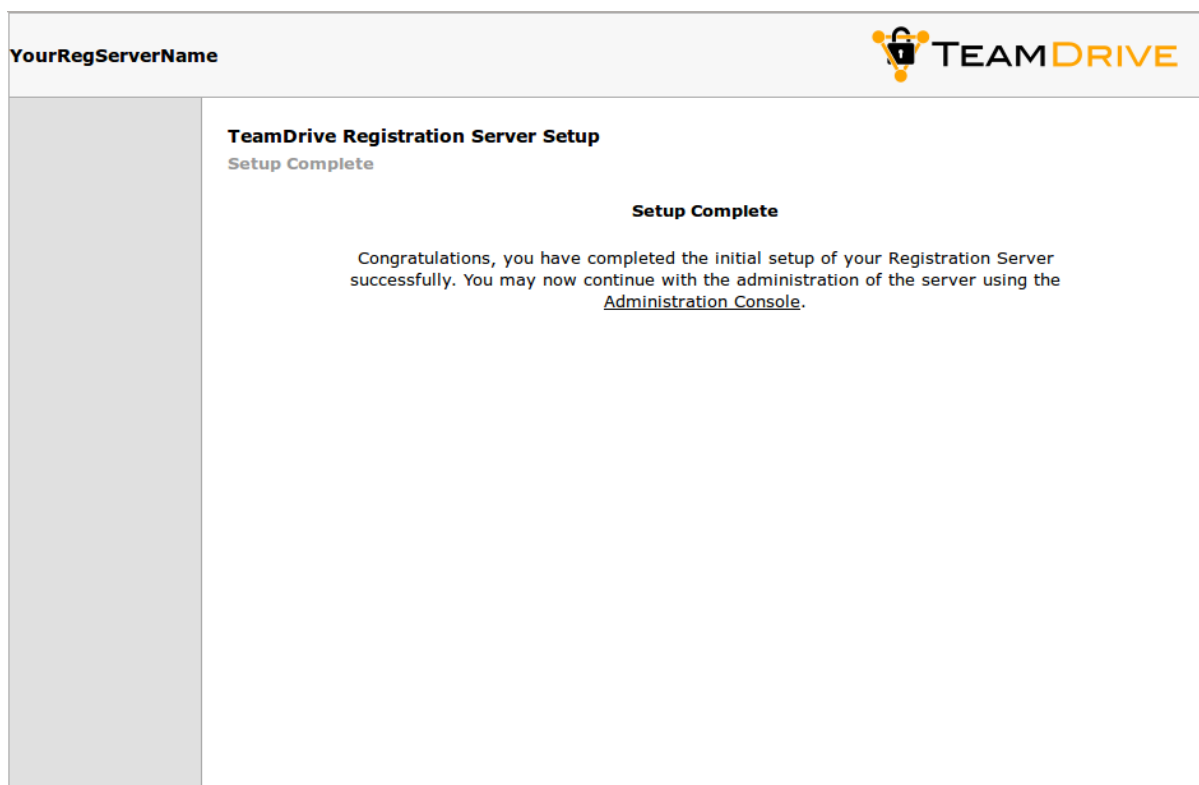

Fig. 6.8: Registration Server: Setup Complete

## STARTING AND STOPPING THE TEAMDRIVE REGISTRATION SERVER COMPONENTS

To make the TeamDrive Registration Server available for TeamDrive Clients to connect, the following services need to be up and running:

- `mysqld` — the MySQL database server (local or on a remote server)
- `httpd` — the Apache HTTP Server
- `td-regserver` — the Yvva based background processes
- `postfix` — the Postfix SMTP server (optional, other MTAs like sendmail or qmail or MTAs on remote servers can be used as well)

After the initial installation, most services except for the `td-regserver` service should already be up and running.

To ensure a proper service start and to minimize error messages on the TeamDrive Client side, the following startup sequence of the TeamDrive Registration Server components and services should be observed.

Start the TeamDrive Registration Server services in the following order:

1. Start the Registration Server MySQL databases service
2. Start the SMTP service (or make sure it's available/accessible)
3. Start the `td-regserver` background service
4. Start the Apache HTTP Server

For testing purposes, you can start these services manually, using the `service` command. In a production environment, these services should be started automatically at boot time, by enabling them via the `chkconfig` tool.

### 7.1 Starting services manually

You can use the `service` command to start services manually:

```
[root@regserver ~]# service mysqld start
[root@regserver ~]# service postfix start
[root@regserver ~]# service td-regserver start
[root@regserver ~]# service httpd start
```

### 7.2 Stopping services manually

Similarly, you can use `service` to stop the services manually:

```
[root@regserver ~]# service httpd stop
[root@regserver ~]# service td-regserver stop
[root@regserver ~]# service postfix stop
[root@regserver ~]# service mysqld stop
```

## 7.3 Enabling Service Autostart

Once the TeamDrive Registration Server setup is done, the MySQL server, Apache http Server, Postfix (optional) and the `td-regserver` service need to be configured to automatically start at system boot.

Use the command `chkconfig` to enable the automatic start for these processes:

```
[root@regserver ~]# chkconfig --levels 235 httpd on
[root@regserver ~]# chkconfig --levels 235 mysqld on
[root@regserver ~]# chkconfig --levels 235 postfix on
[root@regserver ~]# chkconfig --levels 235 td-regserver on
```

**Note:** It's important, that the MySQL service starts before the Apache will start. On CentOS 7 edit the file:

```
/lib/systemd/system/httpd.service
```

and add at the end of the line starting with `After=` the entry `mysqld.service`. This will ensure, that the Apache will start after the MySQL service. You can verify the service start dependencies with (after a reboot of the system):

```
[root@regserver ~]# systemd-analyze critical-chain
```

## 7.4 Logging into the Administration Console

At this point, you can now continue with the administration and configuration of the Registration Server using the Administration Console, which can be reached via the following URL:

<https://regserver.yourdomain.com/adminconsole/>

To log in, enter the login credentials of the Provider account you defined in Step provider setup.

Please see the *TeamDrive Registration Server Administration Guide* for a detailed description of the Administration Console and for further details on the configuration and customization of the Registration Server and the TeamDrive Clients connecting to your Server.

Once you have concluded the configuration, start a TeamDrive Client and register a user account after entering your Provider Code (or log in using a user account that is provided via external authentication or via CSV import).

Consult the TeamDrive Client Documentation for usage details.

## TROUBLESHOOTING

### 8.1 List of relevant configuration files

**/etc/httpd/conf.d/td-regserver.httpd.conf:** This configuration file loads and enables the TeamDrive Registration Server-specific Apache module `mod_yvva.so`. This Apache module is responsible for providing the web-based Registration Server Installer and the Registration Server API.

**/etc/logrotate.d/td-regserver:** This file configures how the log files belonging to the TeamDrive Registration Server are being rotated. See the `logrotate(8)` manual page for details.

**/etc/td-regserver.conf:** This file defines how the `td-regserver` background service is started using the `yvvad` daemon.

**/etc/td-regserver.my.cnf:** This configuration file defines the MySQL credentials used to access the `regdb` MySQL database. It is read by the Apache module `mod_yvva`, the PHP-based Administration Console as well as the `yvvad` daemon that runs the `td-hostserver` background tasks and the `yvva` command line client.

**/etc/yvva.conf:** This configuration file contains configuration settings specific to the Yvva Runtime Environment that are shared by all Yvva components, namely the `mod_yyva` Apache module, the `yvvad` daemon and the `yvva` command line shell.

**/var/www/html/tdlibs/globals.php:** This configuration file defines the MySQL login credentials required for the TeamDrive Registration Server Administration Console.

### 8.2 List of relevant log files

In order to debug and analyse problems with the Registration Server configuration, there are several log files that you can consult:

- `/var/log/td-regserver.log`: The log file of the `mod_yvva` Apache module that performs the actual Registration Server functionality (e.g. Client/Server communication and API calls) and the web-based initial setup process. The amount of logging information can be defined by changing the value `YvvaSet log-level` in configuration file `/etc/httpd/conf.d/td-regserver.httpd.conf`. The following debug levels (with increasing verbosity) can be set: `error`, `warning`, `notice`, `trace` or `debug`. The default is `error`. Changing this value requires a restart of the Apache HTTP Server.

This log file is also used by the `td-regserver` background service (managed by `yvvad`). The amount of logging information can be defined by changing the value `log-level` in configuration file `/etc/td-regserver.conf`. The following debug levels (with increasing verbosity) can be set: `error`, `warning`, `notice`, `trace` or `debug`. The default is `error`. Changing this value requires a restart of the `td-regserver` service using `service td-regserver restart`. This log file needs to be owned by the Apache user. Logging only occurs if the log file exists and is writable by the Apache user.

- `/var/log/httpd/`: The Apache HTTP Server's log files (e.g. `error_log`) might also contain additional relevant error messages that should be checked.

- `/var/log/td-adminconsole-api.log`: A log file to track API accesses from the Admin Console. The location of this log file can be configured with the Registration Server setting `RegServer/ApiLogFile` via the Admin Console. The file needs to be owned by the Apache user. Logging only occurs if this file exists and is writable by the Apache user.
- `/var/log/td-adminconsole.log`: A log file to keep track of various events on the Administration Console, e.g.
  - Failed logins
  - Failed two-factor-authentication attempts (only admin console logins, not client two-factor-authentication attempts)
  - Password changes
  - Changes to security-related Provider/Server settings (login timeouts, API access lists, etc.)
  - Modifications of user account privileges
  - Failed session validations

### 8.3 Enable Logging with Syslog

As outlined in list of relevant log files, the TeamDrive Registration Server logs critical errors and other notable events in various log files by default.

Starting with Registration Server version 3.5 and Yvva 1.2, it is now possible to redirect the log output of most server components to a local `syslog` instance as well.

Syslog support is an essential feature for auditing, security and/or compliance reasons, as it allows you to funnel all log messages into a centralized syslog server.

This makes it easier to monitor the logs for critical events or errors and prevents tampering with the log files in case of a security breach. It also helps to maintain control over the disk space utilization on the server, as growing log files can't accidentally fill up the file system.

To enable syslog support, the log file name in the `log-file` setting has to be replaced with the keyword `syslog`. Optionally, a custom process identifier can be supplied, by appending it to the `syslog` keyword, using a colon as the separator, e.g. `log-file=syslog:my_process_identifier`. If not used, the default process identifier will be used, which is the name of the program executable.

To enable syslog support for the Yvva-based `td-regserver` background service, edit the `log-file` setting in file `/etc/td-regserver.conf` as follows:

```
log-file=syslog:td-regserver
```

You need to restart the `td-regserver` background service via `service td-regserver restart` in order to activate this change. If the `log-level` is set to `debug` you will now see log messages appearing in `/var/log/messages`:

```
Jun 23 14:13:43 localhost td-regserver: notice: yvvad startup
Jun 23 14:13:43 localhost td-regserver: notice: Using config file:
/etc/td-regserver.conf
Jun 23 14:13:43 localhost td-regserver: notice: No listen port
Jun 23 14:13:43 localhost td-regserver: notice: yvvad running in repeat 10
(seconds) mode
```

To enable syslog support for the Registration Server Client/Server communication and API, edit the `YvvaSet log-file` setting in file `/etc/httpd/conf.d/td-regserver.httpd.conf`:

```
YvvaSet log-file=syslog
```

You need to restart the Apache HTTP Server via `service httpd restart` in order to activate this change. If the `log-level` is set to debug you will now see log messages appearing in `/var/log/messages`:

```
Jun 23 14:21:01 localhost mod_yvva: notice: mod_yvva 1.2.1 (May 21 2015
11:00:12) startup OK
```

To enable logging of security related Administration Console events to syslog instead of the log file `/var/log/td-adminconsole.log`, you need to change the Registration Server Setting `Security/EnableSyslog` to `True` via the Administration Console.

Click **Server Management** -> **Registration Server Settings** -> **Security** and change the **Value** for `EnableSyslog` to `True`. Click **Save** to apply the change. From this point on, security relevant events triggered via the Administration Console will be logged to `/var/log/secure`:

```
Jun 23 14:25:36 localhost td-adminconsole-log[4165]: 2015-23-06 14:25:36
[info] [/var/www/html/adminconsole/editSettings.php:38]: RegServer setting
'EnableSyslog' changed from '$false' to '$true' by user 'xxxx'
Jun 23 14:29:58 localhost td-adminconsole-log[4168]: 2015-23-06 14:29:58
[info] [/var/www/html/adminconsole/libs/auth.php:48]: Failed login for
account 'xxxx'
Jun 23 14:34:09 localhost td-adminconsole-log[4161]: 2015-23-06 14:34:09
[info] [/var/www/html/adminconsole/changePassword.php:54]: Password for
account 'xxxx' has been changed
```

## 8.4 Common errors

### 8.4.1 Web Installation: “500 Internal Server Error”

This error can be triggered by several error conditions. Check the log file `/var/log/td-regserver.log` for details.

Some common errors include:

```
[Error] -12036 (2002): Can't connect to local MySQL server through socket
'/var/lib/mysql/mysql.sock' (25)
[Error] "open TD2REG_WRITE dbms option '[regdb]';" (1)
[Error] "sql.pbt" SQL:openDBMSAndDB(387)
[Error] "startup.yv" (32)
```

The local MySQL Server's socket file can't be opened. This could either be a permission problem, or the MySQL Server is simply not available. Check that MySQL is actually up and running (e.g. by running `service mysqld status`) and restart it, if necessary. If the error persists, check the MySQL error log file (usually `/var/log/mysqld.log`) for hints.

Similarly, an error like the following one indicates that a remote MySQL Server might not be answering (e.g. because of a firewall rule or because it's not running):

```
[Error] -12036 (2003): Can't connect to MySQL server on
'mysql.yourdomain.com' (107)
[Error] "open TD2REG_WRITE dbms option '[regdb]';" (1)
[Error] "sql.pbt" SQL:openDBMSAndDB(387)
[Error] "startup.yv" (32)
```

If you see Access denied errors like the following one:

```
[Error] -12036 (1045): Access denied for user 'teamdrive'@'localhost' (using
password: YES)
[Error] "open TD2REG_WRITE dbms option '[regdb]';" (1)
[Error] "sql.pbt" SQL:openDBMSAndDB(387)
[Error] "startup.yv" (32)
```

Either the username or password used to connect to the MySQL Server are wrong. Double check that the MySQL username and password provided in `/etc/td-regserver.my.cnf` are correct, e.g. by trying to connect to the MySQL server using these credentials with the `mysql` command line client.

If you see the following error when connecting to a remote MySQL Server:

```
[Error] -12036 (1130): Host 'regserver.yourdomain.com' is not allowed to
connect to this MySQL server
[Error] "open TD2REG_WRITE dbms option '[regdb]';" (1)
[Error] "sql.pbt" SQL:openDBMSAndDB(387)
[Error] "startup.yv" (32)
```

Check the TeamDrive MySQL user's privileges on the remote MySQL server, e.g. by running `SHOW GRANTS FOR `teamdrive`@`regserver.yourdomain.com``; and make sure that this user is allowed to connect to the MySQL server from the Registration Server's host.

### 8.4.2 Invitation emails are not being sent

If users don't receive invitation emails, there are several aspects that should be checked:

- On the Admin Console, check the "Manage Auto Tasks" page: did the task "Send Emails" succeed and was it run recently (check the value of "laststarttime"?). On the "Manage Email Queue", do you see emails with status "Failed"?
- Is the service `td-regserver` up and running? Check with `service td-regserver status` and use `service td-regserver start` to start the process. Also ensure that the service is configured to be started at system bootup time. See chapter `startingstoppingcomponents` for details.
- Check the `/var/log/td-regserver.log` log file for errors.
- Does sending of email work in general? Try using the `mail` utility and check your MTA logs (e.g. `/var/log/maillog`) for delivery status notifications.

### 8.4.3 Admin console: Error connecting to the MySQL server

If you get an error like:

```
Error connecting to the MySQL server:
MDB2 Error: connect failed
```

Verify that the MySQL Server is up and running and that the connection parameters like username and password in file `/etc/td-regserver.my.cnf` are set up correctly. See chapter `Administration Console MySQL Configuration` for details.

### 8.4.4 Admin console: API error code: -30000, message: Access denied

If some operations on the web-based Administration Console (e.g. changing a configuration option) result in an error message `API error code: -30000, message: Access denied`, the IP address of the server hosting the Administration Console host is likely not on the white list of IPs that are allowed to perform API calls.

Check the content of the Registration Server setting `API_IP_ACCESS` ("Edit Provider Settings" -> "API" -> "API\_IP\_ACCESS") and make sure that the external IP address of the server running the Administration Console is included in the list. If necessary, add the missing address in a new line and click **Save**.

### 8.4.5 Email messages sent by the registration server show encoding issues

Invitation emails and other notifications sent out by the Registration Server are encoded as UTF-8. Before they are sent out, they are first inserted into the MySQL database before the `td-regserver` background service delivers

them to the configured MTA. If you notice encoding issues (special chars or umlauts not displayed properly), check the following:

- Double check that your templates are UTF-8 encoded. The default templates shipped with the TeamDrive Registration Server use the correct encoding, but if you're updating from previous versions, the encoding might be off.

## RELEASE NOTES - VERSION 3.6

TeamDrive Registration Server version 3.6 is the next major public release following after version 3.5.

Version 3.6 of the Registration Server contains the following features and notable differences compared to version 3.5.

### 9.1 Installation

- The Reg Server 3.6 supports CentOS 7. RPM's are available for this version of the OS.

### 9.2 Registration Server Functionality

- Added the “Web Portal Access” capability bit. This bit represents user-level permission to access Web Portals. The capability bit is only used if the `ALLOW_WEB_PORTAL_ACCESS` Provider setting is set to `peruser` (see below).
- Added `ALLOW_WEB_PORTAL_ACCESS` Provider setting. This setting determined whether users are permitted to access a Web Portal or not. Possible settings are:
  - `permit`: All users are permitted to login to Web Portals (this is the default).
  - `deny`: Web Portal access is denied to all users.
  - `peruser`: Access is determined by the “Web Portal Access” capability bit.
- TeamDrive Authentication Services now includes an example of how to connect to Vasco IDENTIKEY Authentication Server. When used in conjunction with the Web Portal, Web Portal version 1.0.6 is required.
- Emails sent by the server now have a maximum size of 16 MB. Previously the limit was 64 K (REGSERVER-1131).
- Implemented support for Two-Factor Authentication using the Google Authenticator App.
- Added the `AUTH_SETUP_2FA_URL` Provider setting. This value must be set to the URL of the page used to setup two-factor authentication.  
See registration server how tos/two factor authentication for details.
- Added `ALLOW_MAGIC_USERNAMES` Provider setting. When set to `True`, users of the Provider may register with usernames that match the standard “magic username” pattern.
- Added `ISOLATED_EMAIL_SCOPE` Provider setting. When set to `True`, the users of the Provider may use email addresses that are in use by other users, as long as the email addresses are unique for the Provider (REGSERVER-1125).
- Added the `HIDE_FROM_SEARCH` Provider setting. When set to `True`, this setting will prevent users from being found by a Client when doing the standard username and email address searches, during login and when inviting users to a Space (REGSERVER-1124).

- Added the `PROVIDER_DEPOT` Provider setting. This setting may be used to specify that a certain Depot should be used as default Depot for all users of a Provider (REGSERVER-1117).
- Added the `SUPPORT_EMAIL` Provider setting. This setting specifies the email address that will be notified if support content is uploaded to the Registration Server.
- Users will now receive “store forward” invitations no matter which Registration Server the invitation is located on. Previously a user had to register on the same Registration Server as the store forward message.  
A store forward invitation is created when a user invites another user via email, but the user is not yet registered.
- HTTPS is now used for all communications with a Host Server if the Provider setting `API_USE_SSL_FOR_HOST` is set to True.
- Added the Registration Server setting: `EmailGloballyUnique`. When set to True the Registration Server will check to ensure that an email address is not in use by any other Registration Server in the TeamDrive Network (REGSERVER-809).

This value is automatically set to the same value as “UserEmailUnique” on upgrade to version 3.6 or later.

See registration server settings/regserver settings/emailgloballyunique for details.

### 9.3 Registration Server API

- Added notifications: the Registration Server can be configured to send a notification when a change is made to a user. To do this, the Provider setting `API_SEND_NOTIFICATIONS` must be set to True, and the setting `API_NOTIFICATION_URL` must be set to the URL that will receive the notification (TRUS-136).
- The tag `<webportal>` has been added to the API functions: “searchuser”, “loginuser”, “getuserdata” and “registeruser”. This tag indicates whether the user is permitted to access a Web Portal.

Note that if the Provider setting `ALLOW_WEB_PORTAL_ACCESS` is set to permit or deny, the the value returned in the `<webportal>` tag will reflect this setting, not the value of the user’s Web Portal Access capability bit.

When calling “setcapability” the `<capability>` tage may be set to the value “webportal”, in order to set Web Portal Access capability bit.

- The “searchuser” API call now accepts the input tags `<distributor>`, `<reference>` and `<authid>`, which are used to search for users with specific external reference or external authentication ID. This tags can be used in addition to or in place of other search tags. The “\*” search wildcard is not recognised which searching for these values.

When searching by `<authid>` the `<distributor>` will automatically be added to the search conditions (normally this is only done when you set `<onlyownusers>true</onlyownusers>`).

Note that setting `<distributor>` to a value other than your own Provider code is only permitted if you are the “Default Provider”. Web Portals working on the behalf of a Provider may also set the `<distributor>` tag accordingly.

- The “registeruser” API call now returns a `<userdata>` block with the complete details of the user.
- Client API: the client version will now be extracted from the path: “/teamdrive/clientversion”, in addition to the paths used previously. Command names are case-insensitive.
- Added the Provider setting `EXT_LICENCE_REF_UNIQUE`, default True. If set to False duplicate license references are allowed (REGSERVER-1130).
- Removed the Provider setting `CLIENT_DEFAULTLICREF`. The license reference must now be provided as parameter to the API call (REGSERVER-1130).
- Updated version number of API to 1.0.007.

- The `<licensereference>` tag can now be used to specify the license in place of the `<licensenum>` tag (REGSERVER-808). Note that the license reference must be unique for each Provider, if `EXT_LICENCE_REF_UNIQUE` is set to `True` (which is the default).
- Added the “sendtemplatemail” API call. This call can be used to send standard template based emails to user, Providers or some other recipient (REGSERVER-1103).
- Added lookup of an Email on TDNS to the “tdnslookup” call. The result is a list of Registration Servers (REGSERVER-1113).

### 9.4 Administration Console

- Added “Delete Provider” Functionality (REGSERVER-1127). Deleting a Provider will delete all user, licenses and depots that belong to the Provider. If the Reg Server is connected to TDNS, the delete process will be suspended until the Provider has been removed from TDNS.
- If too many failed logins are detected for an account, further attempts are subjected to a delay that increases with the number of login attempts, up to a maximum delay of 2 minutes. The previous system of a constant 5 second delay will still be used if the account is protected by the `LOGIN_IP` provider setting (REGSERVER-534)
- Added an option to move spaces from one depot to another (REGSERVER-1116)
- Depot change history can be displayed on the edit-user page, when available (REGSERVER-1040)
- A users Spaces are fetched more efficiently when displaying them on the edit-user page, which solves some browser memory problems when a user has a lot of spaces. Unfortunately this also means that the list of spaces can no longer be sorted (REGSERVER-1122)
- The list of spaces on the edit-user page can now be exported as a CSV document (eg. for opening in Excel) (REGSERVER-1128)
- Users can now be added or removed from a license on the edit-license page (REGSERVER-1129)
- Changing a license owner can now be done only via the edit-license page. The function has been removed from the edit-user and license overview pages to avoid confusion with the ‘add user to license’ function (REGSERVER-1129)
- The Admin Console now displays the Host Server version number. The version number is only correctly updated with Host Server version 3.6.1 or later. Otherwise, the number displayed is the version of the original Host Server installation. Note that, in this case, the version number displayed is of the form: `<major>.<minor>.*.*.<patch>`, for example: Host Server version 3.0.011 (for example) is displayed as: 03.00.\*.\*.00011.

## CHANGE LOG - VERSION 3.6

### 10.1 3.6.8 (2018-02-07)

- Added new Provider EMAIL settings which override the global Registration Server settings (REGSERVER-1226). This makes it possible to specify the SMTP Server to be used to send emails at the Provider level. Support for sending mails using SSL/TLS by prepending the protocol “smtps://” (only supported on CentOS 7 systems due to dependencies of required curl functionality) and authentication with an username and password was added:
  - SMTP\_SERVER: The SMTP Mail Server address (host name), if empty the SMTPServer global setting value will be used.
  - SMTP\_SERVER\_TIMEOUT: the Timeout in seconds when waiting for the SMTP Mail Server, if empty the SMTPServerTimeOut global setting value will be used.
  - SENDER\_HOST: Host name of the email originator. If empty the MailSenderHost global setting value will be used.
  - SMTP\_SERVER\_USER: Username for smtp authentication.
  - SMTP\_SERVER\_PASSWORD: Password for smtp authentication.
- Version 3.6.8 requires YVVA runtime version 1.4.5.

### 10.2 3.6.7 (2017-11-06)

- Fixed a crash when sending email due to incorrect SQL statement (REGSERVER-1223).
- Fixed sending of “Future Device” messages which are used to sent invitations to users that do not yet have a device.
- Documentations has been changed to conform to the new TeamDrive CI.
- Some devices were not receiving invitations because the “Demo” flag was set. This flag is now ignored when invitations are sent.
- Replaced TeamDrive logo and colors
- Improved logging of errors when connected to TDNS, Host Servers and other Registration Servers. If an unexpected reply is received, the server will dump the first 420 characters of the response to the log, in order to help debugging proxy related connection errors.

During setup of a Registration Server details of incorrect results are provided when you press the “Error Details” button. If the server receives an unexpected result when trying to contact other servers then the first 420 characters are display in the dialog window.
- External Auth Service: corrected generation of user secret. Added the “alt user secret” to enable transition to a new method for generating user secrets.

- Added the `SETUP-2FA` conditional variable for the Portal Pages (html and email templates/html templates/portal pages) which is set to “true” if the user selects to setup 2-Factor Authentication during login.

The default **portal-login** page has been altered to use the variable to indicated if the user has selected to setup 2-Factor Authentication or not.

- Fixed a bug in the Web-based setup of the Registration Server that caused a “Unknown attribute: ‘REG\_SERVER\_BUILD’” exception (REGSERVER-1214).
- Registration Setup as Standalone or Master server now requires as “Setup Code”. This is required in order to prevent the accidental installation of a Registration Server that can only be accessed using a customised TeamDrive Client. A Setup Code can be obtained from [support@teamdrive.com](mailto:support@teamdrive.com), but requires an agreement for the deployment of a “white-label” TeamDrive Client.
- Fixed a bug in the Registration Server Setup that prevented the installation of a server when using a proxy to access the Master Registration Server.
- Version 3.6.7 requires YVVA runtime version 1.4.4.

### 10.3 3.6.6 (2017-08-04)

- Fixed an exception that occurred when attempting to wipe a device (REGSERVER-1210).
- Fixed a error that occurred when removing a device installation on the client of a user had already been removed (REGSERVER-1211).

### 10.4 3.6.5 (2017-07-13)

- The Reg Server now handles “store forward” invitations sent by the TeamDrive client, when a user has no active devices (because all devices have been inactive for longer than `InviteOldDevicesPeriodActive`). Previously this only worked if the user had no devices (which can happen if the user was created via the API).

The first device that becomes active after this point, whether it is a new device or an old device that was re-activated will receive the invitation (REGSERVER-1200).

- API call “removelicense” was not working due to a problem with NULL values (REGSERVER-1197).
- Fixed activation of users and devices via the adminconsole (REGSERVER-1199)
- Uploaded Client log files are now stored in a table created to store all large binary values (TD2LargeBinaries). This prevents a slowdown of access to the TD2BlobData table (REGSERVER-1202).

On upgrade the log files will be moved from one table to the other. This can take some time.

- Added a new covering index to the TD2BlobData table that includes all columns used to search the table. This will allow the server to avoid reading the entire row during a search.

The column `TD2BlobData.Extension` has been shortened to 40 bytes (ascii) and the columns `TD2BlobData.SourceChecksum` has been removed because it is no longer used (REGSERVER-1201).

- Optimised the queries used in the CSV page in the Admin Console, and fixed a bug that left the ‘error’ and ‘success’ file in the database when a CSV file was deleted
- Fixed a bug in the “searchuser” API call. When `<showdevice>` was false, the `<total>` was incorrectly set to 0 (REGSERVER-1204).
- Fixed a bug when deleting an user and his depots: If user is not the owner of a depot he must be removed from the depot as an user instead of deleting the depot (REGSERVER-1205).

## 10.5 3.6.4 (2017-05-04)

- Fixed crash in regserverdistribution (REGSERVER-1186).
- Fixed an error that resulted in the `<licensekey>` tag missing from a number of API calls that returned license data (REGSERVER-1187).
- Fixed setting a client update notification using the admin console (REGSERVER-1189).
- The `<intresult>` tag was missing from the result of the “createlicensewithoutuser” API call.
- Several small fixes for the admin console: improved user search speed and added case insensitive search for usernames, fixed regular expression for magic usernames with an ID > 9999, improved client logs download page
- Added hint how to start the apache service after mysql (see enabling service autostart)
- Fixed sending API calls for different provider using the same IP (REGSERVER-1194).
- Fixed license change history in the adminconsole in cases where the ‘license created’ entry was missing from TD2TicketChanges (REGSERVER-1188)
- Require entry of a confirmation text when deleting licenses (previously this was only required if the license was created in an external system) (REGSERVER-1193)
- The default provider can now view uploaded log files for all providers at once (REGSERVER-1190)
- Installation: set `max_allowed_packet=32M` in order to support the upload of large client log files (REGSERVER-1192)
- Fixed a number of problems with the API functions “searchuser” (REGSERVER-1195): It is now possible to retrieve all users by not specifying any search condition. Previously this caused error -30116.

The result tags `<current>`, `<total>` and `<maximum>` now refer to the number of users, regardless of whether devices are included in the result or not. Previously these tags referred to the number of devices, when `<showdevice>` was set to `true`.

Previously it was possible that devices for the last user returned were missing, if the maximum rows (`<total>` value) was exceeded when including devices in the result.

When you specify a `<startid>` value, the `<total>` value returned now consistently refers to the total number of users with an ID greater than the specified value.

This means that, in general, if the `<total>` value is greater than the `<current>` value, then the caller knows that more user records are available with the input parameters.

Previously to version 3.6.4 the result `<total>` was not consistent if `<showdevice>` was set to `true` and should not be used.

- Increased TD2BlobData.Data column size to allow 50 MB uploaded log files (REGSERVER-1191).
- Increased TD2Depots.ReposDoc column size to 4000 characters required to store larger repository files (REGSERVER-1185).

## 10.6 3.6.3 (2017-03-22)

- Added Provider setting `EMAIL/IGNORE_TEMPLATES_LIST`, which contains a list of email templates. Emails will not be sent with the templates specified in this list (REGSERVER-1184).
- Added the `UsePrecedenceBulk` setting which determines whether the “Precedence: bulk” header should be added to outgoing emails (REGSERVER-1182).
- The `activatelicense` and `deactivatelicense` API calls no longer return error -30210 (REGSERVER-1177).

- Specifying a user in the “removeuserfromlicense” API call is now optional. If specified, then the user must be the owner of the license or a “Unknown license” error will be returned (REGSERVER-1178).
- The API documentation now includes a section on the changes to the API based on the Registration Server version. All changes since version 3.5.0 are noted in the documentation of the API calls (REGSERVER-1173).
- Remove the API version number (1.0.006, 1.0.007, etc.) The Registration Server version number is now used to determine when API changes have been made. All API calls now return the `<regversion>` tag which contains the version number of the server (REGSERVER-1173).
- “getdefaultlicense” API call: removed the exception that returned the features of the license in use if it was higher than the features of the default license.
- Added a `<licensereference>` tag to the input parameters of the “loginuser” call. This tag is used if a default license is created for the user. This is only done if the user has no default license, and the Provider setting `DEFAULT_LICENSEKEY` is empty.
- The new reference should now be specified using the `<newlicensereference>` tag in the “setlicensereference” API call.
- Added an optional `<password>` tag to the “removeuser” API call input data.
- The `<featurevalue>` tag value may now also be specified as an integer in the “createlicense”, “createlicensewithoutuser”, “upgradelicense” and “downgradelicense” API calls.
- Added the `<licensereference>` tag to the `<license>` block in reply of the “getusedlicense” API call.
- Added the `<licensereference>` tag to the `<user>` and the `<device>` block in reply of the “searchuser” API call.
- Fixed a bug removing users from a depot who had been added to the depot when it was created (REGSERVER-1159)
- Several minor changes and fixes in the Admin Console (fixed spelling License -> Licence, moved “change user licence” on the edit user page from device block to user block, fixed 2 SQL statements, added username to client logs download page)
- Added new clients settings `allow-webaccess-by-default` and `enable-space-webaccess` in the documentation

### 10.7 3.6.2 (2017-02-01)

- The Registration Server Portal Pages (see `html` and `email templates/html templates/portal pages`) will no longer allow login of users that have previously logged in using an external authentication service (REGSERVER-1180).
- If a user is using external authentication then the server will no longer allow the user to change his password. The server now returns an error -24907: Permission denied, when the TeamDrive client attempts to perform on of these functions (REGSERVER-1179).
- External authentication now first checks whether the authentication token is an internal token used by the portal pages. If not, it checks the URL specified by the `AUTH_LOGIN_URL` setting (REGSERVER-1181).
- The `<licensekey>` tag must be used in place of the `<licensenumber>` tag in the API. `<licensenumber>` has been deprecated and will no longer be accepted in Registration Server 3.7.
- Add a `<licensekey>` tag to the “registeruser” API call. This tag can be used to specify a license to assign to the newly created user.
- Added Provider setting `USER_IDENTIFICATION_METHOD` (REGSERVER-1171). This setting determines how user accounts will be identified (see `provider settings/client settings/user_identification_method`). `USER_IDENTIFICATION_METHOD` replaces the Provider setting `USE_EMAIL_AS_REFERENCE`, which has been removed.

- Removed the Provider setting `API_CREATE_DEFAULT_LICENSE` (REGSERVER-1163). A default license is now always created when a user is created by the API, or during TeamDrive Client registration.  
Since the Registration Server version 3.6 now allows a license to be assigned to a user, even when the user has no devices, the default license is also assigned to the user on creation via the API. If the license already has the maximum number of users, the new user will not be created.
- Fixed a bug that caused the switch-distributor function to always create a new depot and license even when the checkboxes were not selected (REGSERVER-1170)
- Added new server setting `PrivacyURL` and Provider redirect page `REDIRECT_PRIVACY`
- Added fields to select an existing license when creating a new user in the adminconsole (REGSERVER-1166)
- Can now filter the list of devices by the username or email address of the user who owns the device (REGSERVER-1160)
- It is now possible to edit licenses with an “extreference” set (REGSERVER-1168)

### **10.8 3.6.1 (2016-12-02)**

- Fixed a crash that occurred when search user was called from a TeamDrive Client that is registered at a different Registration Server (REGSERVER-1161)

### **10.9 3.6.0 (2016-11-25)**

- Initial release.
- LDAP/AD Connectivity (REGSERVER-506): The LDAP/AD external authentication reference code has been improved so that all important parameters are in one configuration file.  
The file “`ldap_config.php.example`” must be duplicated and renamed to “`ldap_config.php`” on installation. The file parameters should then be modified as required. Further instructions and a description of the parameters is provided in the “`ldap_config.php`” file.

## RELEASE NOTES - VERSION 3.5

TeamDrive Registration Server version 3.5 is the next major public release following after version 3.0.018.

---

**Note:** Please note the the version numbering scheme for the Registration Server has been changed starting with version 3.5. The first two digits of the version string now identify a released version with a fixed feature set. The third digit, e.g. “3.5.1” now identifies the patch version, which increases for every public release that includes backwards-compatible bug or security fixes. A fourth digit identifies the build number and usually remains at zero, unless a rebuild/republishing of a release based on the same code base has to be performed (e.g. to fix a build or packaging issue that has no effect on the functionality or feature set).

---

Version 3.5 of the Registration Server contains the following features and notable differences compared to version 3.0.018. This includes all changes made for version 3.0.019, which was an internal interim release used to deploy and test most of the new functionality described below.

### 11.1 Installation

- The initial configuration and initialization of a Registration Server is no longer performed by filling out the `RegServerSetup.xml` file and running the `RegServerSetup.pbt` script on the command line. Instead, a web-based setup process has been implemented, which guides the administrator through the steps involved.
- The Registration Server no longer depends on the PrimeBase Application Environment (e.g. the `mod_pbt` Apache module or the `pbac` command line client), provided by the RPM package `PrimeBase_TD` in version 3.0.018). Instead, it is now based on the Yvva Runtime Environment which is already used for the TeamDrive Host Server since version 3.0.013 and newer. The environment is provided by the `yvva` RPM package, which will automatically replace any installed `PrimeBase_TD` RPM package during an upgrade. The central log file `/var/log/td-regserver.log` is the central log location for all Yvva-based components; the previous log files (e.g. `/var/log/pbt_mod.trace`, `/var/log/pbvm.log` or `/var/log/pbac_mailer.log`) will no longer be used.
- The Apache HTTP Server configuration file for the Registration Server has been renamed from `/etc/httpd/conf.d/pbt.conf` to `/etc/httpd/conf.d/td-regserver.httpd.conf`.
- The installation no longer requires the Apache HTTP Server to be configured using the “worker” MPM, which simplifies the overall installation and configuration of the base operating system and allows for using the PHP Apache module instead of the FastCGI implementation for the Administration Console.
- The login credentials required to access the Registration Server’s MySQL database server are now stored in a single configuration file `/etc/td-regserver.my.cnf`, which is consulted by all components (e.g. the Administration Console, Registration Server or the Auto Task background service).
- The background service providing the Registration Server Auto Tasks has been renamed from `teamdrive` to `td-regserver` and is now based on the `yvva` daemon instead of the PrimeBase Application Client `pbac`. Please make sure to update any monitoring systems that check for the existence of running processes. The configuration of the `td-regserver` background service is stored in file `/etc/td-regserver.conf`.

- The PBT-based code of the Registration Server is no longer installed in the directory `/usr/local/primebase`. The content of the `td-regserver` RPM package has been restructured and relocated to the directory `/opt/teamdrive/regserver`.

## 11.2 Registration Server Functionality

- Added support for the new business model introduced with TeamDrive 4 Clients (e.g. full support for trial licenses with an expiration date, restricted Client functionality via Client settings).
- The CSV import of user accounts is no longer performed by a cron job running a separate PHP script anymore. Instead, there is now an additional “CSV Import” Auto Task that provides this functionality.
- Email and HTML activation page templates are no longer stored and managed in the Registration Server’s file system. Instead, they are now stored in the Registration Server’s database and managed via the Registration Server Administration Console. During an upgrade from a previous version, any existing template files will be imported from the file system into the database. As a result, the following server settings have been deprecated and will be removed during an upgrade: `PathToEmailTemplates`, `ActivationURL`, `ActivationHtdocsPath`, `HTDocsDirectory`.
- The “Move Store Forward Messages” Auto Task has been removed, as it’s no longer required. Store Forward invitations are now forwarded automatically, when a user activates the new account.
- Some license related provider settings have been moved from the `CLIENT` category to the more appropriate `LICENSE` category, namely `CLIENT_DEFAULTLICREF`, `DEFAULT_FREE_FEATURE` and `DEFAULT_LICENSEKEY`.
- The provider setting `API/API_USE_SSL_FOR_HOST` has been moved into the more appropriate `HOSTSERVER` category.
- A number of Registration Server Settings that used to apply to all providers hosted on a Registration Server can now be defined on the provider level. The following provider settings have been added:
  - `API/API_REQUEST_LOGGING`: Set to `True` to enable logging of API requests in the API log. The value is `False` by default.
  - `EMAIL/USE_SENDER_EMAIL`: Set to `True` if you wish to use the actual email address of the user when sending emails to unregistered users, otherwise the value of `EMAIL_SENDER_EMAIL` is always used.
  - `HOSTSERVER/AUTO_DISTRIBUTE_DEPOT`: Set to `True` if the Depot should be distributed automatically.
  - `LICENSE/ALLOW_CREATE_LICENSE`: Set to `True` to allow the creation of licenses. The value is `False` by default and can only be changed by the default provider.
  - `LICENSE/ALLOW_MANAGE_LICENSE`: Set to `True` to allow the management of existing licenses. The value is `False` by default and can only be changed by the default provider.
- Log messages and errors from the Yvva-based Registration Server components as well as the Administration Console can now be logged via `syslog` as well.

## 11.3 Registration Server API

Numerous enhancements and additions to the Registration Server API, to provide more functionality for integrating with external applications (e.g. web shops).

- Added API call `deletelicense`, which marks a license as “deleted”. The API call `cancellicense` will set a license to “disabled” instead of “deleted” now.
- Added API call `tdnslookup`, which performs a lookup at the TeamDrive Name Service (TDNS) to find a given user’s Registration Server.

- Added new functions: `deactivateuser`, `disableuser`, `enableuser`, updated API reference documentation accordingly.
- Added new function `setdepartment` to set the department reference for a user.

## 11.4 Administration Console

Various security and usability enhancements as well as modifications to support changes made to the Registration Server API and functionality.

### 11.4.1 Usability Improvements

- Re-organized the navigation for the various Administration Console pages, ordered and grouped them in a more logical fashion.
- Error messages when making changes to the Provider or Registration Server Settings are now displayed more prominently.
- The Administration Console now prohibits the manual creation of Depot files for system accounts such as a Host Server's `tdhosting-<hostname>` user.
- The workflow of the **Create Depot** page has been reworked to be more straightforward, and will perform better validation to prevent users from different providers getting assigned to the same Depot. The form now also allows creating a depot as the default depot for the selected user. (REGSERVER-700, REGSERVER-907, REGSERVER-913)
- The login page now displays a notice to enable JavaScript if JavaScript is disabled in the user's browser. (REGSERVER-916)
- You can now filter the license table by expiry date, contract number, and holder email. The contract number and holder email have been added to the table, and the rest of the columns have been compacted slightly to create more space. (REGSERVER-885)
- Trial licenses are marked with a "Trial: <end date>" tag in the "More Details" section of the user overview table, the user editing page, and the license overview. (REGSERVER-891)
- The user overview will display 'N/A' rather than 'Free' as the user's highest license, if the user has no installations yet. (REGSERVER-904)
- Banner management: Example banner elements are now downloaded with an appropriate file name. (REGSERVER-725)
- Searching for a username on the main user list is now case insensitive when the entire username is provided. (REGSERVER-906)
- Most of the input forms on the Administration Console will automatically trim leading and trailing whitespace from text fields. (REGSERVER-912)
- Can reset/delete multiple messages in the email queue at once (REGSERVER-773)
- Can delete multiple CSV-import log files at once (REGSERVER-990)
- The email templates are sorted into categories which can be shown or hidden. Categories of templates that are not relevant (based on provider settings) are hidden by default (REGSERVER-1026)
- The create-provider dialog will only show the TDNS related fields if TDNS access is enabled in the registration server settings (REGSERVER-1032)
- Multiple spaces can be deleted at once, without requiring a complete page reload (REGSERVER-573)
- Deleted licenses are hidden by default, and can be shown by setting a filter option (REGSERVER-825)
- Merged the "LoginSecurity" server settings group into the "Security" group
- Edited some table column labels to be more descriptive (REGSERVER-1057)

## 11.4.2 Security Enhancements

- The Administration Console can now be configured to require two-factor authentication via email for users that want to log in. The provider-specific setting `LOGIN/LOGIN_TWO_FACTOR_AUTH` can be used to enable this feature. Two-factor authentication is disabled by default.
- A Password complexity level is now indicated when creating/changing passwords.
- Security relevant events are logged either into a local log file `/var/log/td-adminconsole.log` or via `syslog`. In particular, the following events are logged:
  - Failed logins
  - Failed two-factor authorization attempts
  - Changes to security-related Provider/Server settings (e.g. login timeouts, API access lists, etc.)
  - Password changes
  - Changes to the privileges of user accounts
  - Failed session validations
- If the account being logged into already has an active session, require a two-factor authentication step.
- Added server settings that can be used to limit the number of records that may be viewed in the console. (`SearchResultLimit`, `UserRecordLimit`, `UserRecordLimitInterval`)
- When logging in to an account that already has an active session, there is the option to immediately end existing sessions (after completing the two- factor authentication step) (REGSERVER-1036)
- The `Manage Servers` page no longer lists all servers on the TDNS network. Instead, there is an option to either enable/disable communication with all other Registration Servers, and exceptions to the chosen default need to be set by entering the exact server name. This is done so that the name of a customer's Registration Server is not automatically visible to everyone else on the TDNS network (REGSERVER-1042).

## 11.4.3 Added Functionality

- It is now possible to edit the list of users belonging to a Space Depot on the user editing page (REGSERVER-905). Editing of Depots (change limits, delete, activate, etc.) now takes place in a separate dialogue.
- Added a page that can be used to edit the HTML templates for web pages.
- The Administration Console now adds the `<changeinfo>` tag to the following Host Server API calls: `createDepot`, `(de)activateDepot`, and `createDepot`.
- Added functionality to resend Depot information to the user. (REGSERVER-896)
- The Administration Console now uses the Registration Server API to enable/disable/wipe user accounts. (REGSERVER-803)
- Licenses will now be marked as “deleted” with the new `deletelicense` API function. (REGSERVER-883)
- Removing a user from a license will now also remove that license from the user's devices. (REGSERVER-720)
- Licenses are edited strictly via the API, added the **Send email** button to all forms, made license type editable.
- Added support for the new API calls, added support to manage the new license feature flag “Restricted Client” (which allows to enable configurable Client-side restrictions like the maximum number of Spaces).
- Client log files and support requests can now be viewed on the “Download Client Log Files” page. The default provider can view log files for all providers. (REGSERVER-1025 and REGSERVER-1024)

- If the default provider has assigned a hostserver to another provider via the HOST\_SERVER\_NAME setting, the other provider will be able to create depots on that server even if the provider would not normally have access to the server

## CHANGE LOG - VERSION 3.5

### 12.1 3.5.9 (2017-01-16)

- Added `<showlicense>true/false</showlicense>` tag to the “searchuser” API call. When set to `true`, license information is returned in the result. This includes `<licensenum>`, `<featurevalue>` and `<licensestatus>` tags in the `<user>` tag which indicate the current license set for the user, and the features of the license. A `<licenselist>` tag is also returned with a list of the licenses that belong to the user.
- Avoid adding or removing the depot owner from the user list (REGSERVER-1158)
- Added a new server PrivacyURL and Provider redirect page

### 12.2 3.5.8 (2016-08-26)

---

**Note:** Version 3.5.8 will fix an error in the depot documents as described below in REGSERVER-1141. To save the successful update the file `/var/opt/td-regserver/StartupCache.pbt` will be updated. This might fail in case of the wrong user “root” ownership. Please correct the ownership with:

```
chown apache:apache /var/opt/td-regserver/StartupCache.pbt
```

---

**Note:** Updating the registration server on CentOS 7 with “yum update” might update the apache to a newer version. This update could re-install the deleted “conf”-files in the folder `/etc/httpd/conf.modules.d/` and will prevent starting the apache. Please follow the modified instruction to disable all modules in the “conf”-files instead of deleting them as described in `configure-apache-24`

---

- Documented additional client settings and ordered client settings alphabetically.
- Fixed the problem that email notifications, such as comments on files, to users on other Registration Servers were ignored. In future, only registered and activated users will be able to send emails. However, the sender can specify an email address instead of a username, in order to send a notification to non-registered users, or users on other Registration Servers (REGSERVER-1147).
- The Host Server may return a Depot document with a `SERVERFLAGS` field with an incorrect terminator. These documents will be corrected in the database and when returned by the Host Server (REGSERVER-1141).
- Fixed a bug in “wipedevice” API call (REGSERVER-1139)
- The adminconsole will make requests to hostservers over the hostserver proxy, if one is configured (REGSERVER-1148)

## 12.3 3.5.7 (2016-07-12)

- Fixed a bug in “createlicense” API call: if the user has no other default license, then the created license will now be correctly set as the default.
- The [[GREETING]] in emails templates: “inv-user-invited-passwd” and “inv-user-invited”, incorrectly used the name of the sender of the invitation, instead if the invitee (REGSERVER-1136).
- Deleting users, depots, or spaces in the Adminconsole now requires the user to type the word ‘DELETE’ in a confirmation dialog, to prevent accidental deletion (REGSERVER-1133)

## 12.4 3.5.6 (2016-06-21)

- The ssl configuration has changed. All settings are now located in a separate configuration file. Please remove the old configuration in your ssl.conf:

```
RewriteEngine on
RewriteLogLevel 0
RewriteLog "/var/log/httpd/rewrite.log"

RewriteRule ^/setup$ /setup/ [R]
RewriteRule ^/setup(.*) /yvva/setup$1 [PT]
RewriteRule ^/pbas/td2as/(.*)$ /yvva/$1 [PT]
RewriteRule ^/pbas/td2api/(.*)$ /yvva/$1 [PT]
```

and add the new include as described in chapter configure-mod-ssl

- The authenticate call now handles authentication tokens that do not contain an email address. The allows an external Authentication Service prevent the automatic creation of a user if the user does not exist.

If the email address is missing from the authentication token then the Registration Server will return the “user not found” error if the user ID in the authentication does not match an existing user.

As before the user ID in the token is compared to the “External Authentication ID” field of the user. This field can be edited in the Admin Console, if USE\_AUTH\_SERVICE is enabled (set to True). If users are not created automatically then it is most likely that this field must be set manually when the user is created.

The alternative is to import the value of the “External Authentication ID” when creating and users using the CSV import facility.

- Updated Yvva version to 1.3.6 (required with CentOS 7)

## 12.5 3.5.5 (2016-05-14)

- Add support for CentOS 7 with apache 2.4
- When a user is removed, if the users licenses are not removed, the licenses are now correctly freed so the may be assigned to another user (REGSERVER-1120) . Note that the default license is no longer a default license when freed.
- Corrected handling of default license. This could be overbooked (REGSERVER-1119). If a default license is assigned to the owner, and it is overbooked, then it will now be automatically removed from a number of users as required. Removal begins with less active users (users that accessed a device more recently will be favoured when removing licences).

When a license is removed, the user license is reset to the user’s default. Note that this may fail if the user is not the owner of his/her default license, which may be the case when using the DEFAULT\_LICENSEKEY Provider setting.

- When changing the Provider of a user update of TDNS was not correct in the case when the case-sensitivity of usernames changed (REGSERVER-361).

- The order of the XML tags in the API documentation now matches the actually order of tags returned by the server. Some tags that were omitted have been added (REGSERVER-949).
- Added `<intresult>` tag to result of “createlicense” API call.
- No longer send email notification message for 4.3.1 clients, because they are able to synchronise user data using the “mod protocol” (REGSERVER-1110).

### 12.6 3.5.4 (2016-01-25)

- The contents of the `<message>` tag in an exception was not correctly encoded which lead to invalid XML returned by the `DISTRIBUTOR_REDIRECT (-30004)` exception, which includes a URL in the message tag.
- Fixed a crash which could occur when assigning a license to a user with a device that was not activated (REGSERVER-1104)
- `/bal/*html` and `/act/*html` URLs were incorrectly returning “text/xml” as content type. This has been changed to “text/html” (REGSERVER-1106).

### 12.7 3.5.3 (2016-01-14)

- Added a “Registration Server How To’s” chapter to the Admin Guide.
- The transfer limit for depots on hostservers that do not enforce the traffic limit is now displayed as ‘Unlimited’ (REGSERVER-742)
- Added ‘,’ to the reserved characters that are not allowed in usernames. This is in addition to ‘;’ and ‘\$’.
- When `DEFAULT_LICENSEKEY` is specified the setting `PROFESSIONAL_TRIAL_PERIOD` no longer has an effect. It is considered to be 0, which means that no trial period is available.
- `ClientPollInterval` was incorrectly stored in the database in seconds by the Admin Console. The unit used in the database is 0.2 seconds (i.e. seconds x 5). This has been corrected. Default value is 60 seconds, as before.
- Fixed a bug editing / deleting depots belonging to a provider other than the default provider
- The “registeruser” API call will now always returns a `<username>` tag as well as the standard `<intresult>` tag on success. For example:

```
<teamdrive><username>$NEW1-1061</username><intresult>0</intresult></teamdrive>
```

This is useful if the caller wishes to know the magic username generated by the server (REGSERVER-838).

- Implemented “one-off-secureoffice-trial” license purchase. This will allow users to start a trial period when using the SecureOffice version of TeamDrive.
- Removed the following Registration Server settings: `MediaURL`, `NotificationURL`, `RedirectorURL`, `UpdateAvailableURL`. All these Settings now use hard-coded URLs that reference the Registration Server (REGSERVER-1100).
- Removed all references to `providerinfo.html` and `clientinfopage.php`. These were used as default redirect pages. Now, if no redirect URL is set, the Registration Server will return a HTML page with a message. For example, if a forum URL is not specified by the Provider (`REDIRECT_FORUM` setting), or in the Registration Server setting (`ForumURL`), then a page with the message: “Sorry, your service provider has not specified a forum page”, will be returned (REGSERVER-1080).
- The `LoadBalancerURL` may contain multiple URLs separated by a ‘|’ character. In this case, the Team-Drive Clients will automatically use a different URL for each call the Registration Server.

- Removed `BalanceURL` Registration Server setting. TeamDrive Clients that still use this setting will be directed to a hard-coded URL on the Registration Server: `http://<reg-server-domain>/pbas/td2as/bal/server.xml` (REGSERVER-917).
- Fixed the “MAIL FROM:” header in emails sent. The Reg Server now correctly sets this field according to the `MAIL_SENDER_EMAIL` Provider setting (REGSERVER-1099)
- If a user is created via the API, or by CSV import, then it may not be known which language the user will use. In this case the language may be set to “-”. The “-” will be ignored by the TeamDrive Client. API calls will return the default language in this case (REGSERVER-1097)
- Fixed a bug: the language passed to the Reg Server on registration was incorrectly converted to upper case and stripped of the location information. The unconverted language sent by the Client is now stored in the database (REGSERVER-1097)
- Fixed a bug in the admin console displaying the license language when editing (REGSERVER-1096)
- The Reg Server now supports a single Web Portal that manages internet access for multiple providers. This means that Multiple providers can use the same IP number in the `API_WEB_PORTAL_IP` setting (REGSERVER-1095)

### 12.8 3.5.2 (2015-12-04)

- Changed API function “confirmuserdelete”: allow using the call without sending the user password (REGSERVER-1089)
- Fixed sending Store Forward invitation for a “standalone” Registration Server (REGSERVER-1092)
- Fixed API function “setdistributor” to handle more than one depot in case of `switchdepot = true` (REGSERVER-1087)
- Fixed sending a store forward invitation in case of device not found fails, if sender is registered at a foreign Reg-Server (REGSERVER-1088)
- AdminConsole: Fixed misleading error message in case of deleting a user

### 12.9 3.5.1 (2015-11-04)

- Fixed api call “setdepotforuser” and “removedepotfromuser”: The depot information sent to the clients used a wrong format (REGSERVER-1085)
- API log view in the admin console will now display API requests from the Web-Portal (REGSERVER-1083)
- Greetings macro was not replaced in mail templates (REGSERVER-1079)
- Added hint in the admin console to show if the background task for sending mails and processing other background tasks is running (REGSERVER-1078)
- Added API call “changelicensepassword” (REGSERVER-1075) and use `bcrypt` for license password encryption (REGSERVER-965)
- Fixed API access in the Apache configuration using the URL from older API documentations (using `../td2api/..` in the URL instead of `../td2as/..`) (REGSERVER-1071)
- Fixed deleting a depot for an user in the admin console. Depot was deleted on the Host Server, but the reference on the Registration Server was not removed (REGSERVER-1070)
- Fixed access to missing language column in the email change confirmation page (REGSERVER-1069)
- Fixed wrong path to `tdlibs-library` folder in `upload.php` (REGSERVER-1067)
- Changed the default value for the setting `TDNSAutoWhiteList` to `True` (REGSERVER-1072) and handle the special case of the Master-Server when changing the setting back to `false` in the admin console. Master-Server could only be disabled when using a white label client (REGSERVER-1073)

- Fixed api call “getusedlicense” to avoid duplicate usernames in user list (REGSERVER-1066)
- Fixed connecting TeamDrive Master Server during the setup in case of server-type “standalone” (REGSERVER-1064)
- Replaced TeamDrive 3 screenshot with TeamDrive 4 in chapter “TeamDrive Client-Server interaction” (REGSERVER-977)
- Added hint in documentation to enable HTTPS for the API communication between Registration Server and Hosting Server (REGSERVER-499)

## **12.10 3.5.0 (2015-09-21)**

- Initial release.

## RELEASE NOTES - VERSION 3.0.019

TeamDrive Registration Server version 3.0.019 is the next major release following after version 3.0.018.

Version 3.0.019 contains the following features and notable differences compared to version 3.0.018:

- Support for the new business model introduced with TeamDrive 4 Clients (e.g. full support for trial licenses with an expiration date, restrict Client functionality via settings).
- Numerous enhancements and additions to the Registration Server API, to provide more functionality for integrating with external applications (e.g. web shops).
- Administration Console: added support for the new API calls, added support to manage the new license feature flag “Restricted Client” (which allows to enable configurable Client-side restrictions like the maximum number of Spaces).
- API call `removeuserfromlicense` failed in case of empty `<changeid>`
- Added API call `deletelicense`. The API call `cancellicense` will set a license to disabled instead of deleted now.
- Administration Console: The workflow of the **Create Depot** page has been improved and now allows creating default Depots for users that do not yet have a default Depot.
- Administration Console: can set whether or not a user should receive the newsletter when creating and editing users

### 13.1 Change Log - Version 3.0.019

#### 13.1.1 3.0.019.8 (YYYY-MM-DD)

- Fixed the key-repository count on the edit-user page (REGSERVER-1020)
- Fixed an issue where the Administration console was not using the correct API functions when adding or removing users from a depot (REGSERVER-1061)

#### 13.1.2 3.0.019.7 (2015-07-08)

- Fix for handling update notifications between version 3.x and 4.x. 3.x clients will not get a 4.x upgrade notification (REGSERVER-985)

#### 13.1.3 3.0.019.6 (2015-07-07)

- Can now set the newsletter capability bit when creating and editing users (REGSERVER-1010, REGSERVER-1015, REGSERVER-1008, REGSERVER-1007)
- Added new templates to confirm receiving a newsletter (REGSERVER-1009)

- Handle messages larger 20K to use 1.0 encryption to avoid timeouts (500x faster than 2.x encryption) (REGSERVER-1014, REGSERVER-1012, REGSERVER-418)

### **13.1.4 3.0.019.5 (2015-06-23)**

- Fixed bug caused by WEB\_PORTAL\_IP handling (REGSERVER-969)
- Administration Console: Support Host Server version 3.0.010 (REGSERVER-976)
- Extend TDNSRequest to handle provider code returned from TDNS (REGSERVER-980)
- Handling update notifications between version 3.x and 4.x. 3.x clients will not get a 4.x upgrade notification (REGSERVER-985)
- Activation code length for email change reduced (same logic as requesting a new password)
- API: upgradedefaultlicense and downgradedefaultlicense accepts the feature strings instead of license bits

### **13.1.5 3.0.019.4 (2015-06-02)**

- Administration Console: It is now possible to edit the list of users belonging to a Space Depot on the user editing page (REGSERVER-905). Editing of Depots (change limits, delete, activate, etc.) now takes place in a separate dialogue.
- Administration Console: Display a notice to enable JavaScript if JavaScript is disabled in the user's browser. (REGSERVER-916)
- Administration Console: fixed a bug that could cause entries in the license- change history to appear in the wrong order (REGSERVER-943)
- API: Function setreference() use newreference XML tag (REGSERVER-936)
- Fixed access to statistic database (REGSERVER-941)
- API: Added tdnslookup-call (REGSERVER-956)
- API: Fixed searchuser-call (handling user and device status)
- API: Security improvement when to switch distributor
- API: Added WEB\_PORTAL\_IP to allow API access from the web prtal

### **13.1.6 3.0.019.3 (2015-04-09)**

- Administration Console: Fixed a bug then when editing licenses, the correct license type will now be displayed.
- Administration Console: Select the 'yearly' license type by default when creating licenses.
- Administration Console: Will send the correct license-type identifier to the API when creating TDPS licenses.
- Administration Console: The Administration Console now uses the Registration Server API to enable/disable/wipe user accounts. (REGSERVER-803)
- Administration Console: Added functionality to resend Depot information to the user. (REGSERVER-896)
- Administration Console: You can now filter the license table by expiry date, contract number, and holder email. The contract number and holder email have been added to the table, and the rest of the columns have been compacted slightly to create more space. (REGSERVER-885)
- Administration Console: Trial licenses are marked with a "Trial: <end date>" tag in the "More Details" section of the user overview table, the user editing page, and the license overview. (REGSERVER-891)
- Administration Console: Licenses will now be deleted with the new deletelicense API function. (REGSERVER-883)

- Administration Console: The user overview will display ‘N/A’ rather than ‘Free’ as the user’s highest license, if the user has no installations yet. (REGSERVER-904)
- Administration Console: The **Create Depot** page has been reworked to be more straightforward, and will perform better validation to prevent users from different providers getting assigned to the same Depot. The form now also allows creating a depot as the default depot for the selected user. (REGSERVER-700, REGSERVER-907, REGSERVER-913)
- Administration Console: Searching for a username on the main user list is now case insensitive when the entire username is provided. (REGSERVER-906)
- Administration Console: Most of the input forms on the Administration Console will automatically trim leading and trailing whitespace from text fields. (REGSERVER-912)
- API: Fixed a bug in the `wipedevice` function that prevented the “wipeout pending” flag to be set. (REGSERVER-892)
- API: Fixed a bug in the `sendinvitation` function that caused additional Depots not longer to be sent to a user’s devices. (REGSERVER-896)
- API: Fixed a bug creating default licenses for a user belonging to a different provider. (REGSERVER-889)
- Installation: Fixed a minor syntax error in `RegServerSetup.pbt`
- See the changelog-3.0.018.8 change log for additional changes.

### 13.1.7 3.0.019.2 (2015-03-05)

- Administration Console: Added support for setting the `restricted` feature flag on licenses (previously labeled `enterprise`).
- Administration Console/Documentation: Updated the TeamDrive logo to the new branding.
- Administration Console: Check a license’s `extreference` before allow editing of TDPS licenses. (REGSERVER-855)
- Administration Console: Continue to show only the selected license after jumping to a specific license in `licenceAdmin.php` and then removing a user from it.
- Administration Console: Licenses are edited strictly via the API, added the **Send email** button to all forms, made license type editable.
- API: Added new functions: `deactivateuser`, `disableuser`, `enableuser`, updated API reference documentation accordingly.
- Registration Server: added check to handle an empty `LicenseEmail` field when sending out license change notifications to a provider. (REGSERVER-871)
- See the changelog-3.0.018.7 change log for additional changes.

### 13.1.8 3.0.019.1 (2015-02-19)

- API: Added new function `setdepartment` to set the department reference for a user.
- Administration Console: Added `<changeinfo>` to the following Host Server API calls: `createDepot`, `(de)activateDepot`, and `createDepot`.
- Registration Server: Fixed bug in returning the Server’s capability bits to the Client.
- See the changelog-3.0.018.6 change log for additional changes.

### 13.1.9 3.0.019.0 (2015-01-22)

- Initial release (based on 3.0.018.5).

## RELEASE NOTES - VERSION 3.0.018

TeamDrive Registration Server version 3.0.018 is the next major release following after version 3.0.017.

Version 3.0.018 contains the following features and notable differences compared to version 3.0.017:

- As a security enhancement, TeamDrive user passwords stored on the Registration Server are now hashed using the bcrypt algorithm instead of the previously used salted MD5 method. When logging in with a TeamDrive Client version 3.2.0 (Build: 536) or newer, existing hashed passwords are automatically converted into the new format.
- Changing, invalidating or resetting a user's password now also triggers sending an email to the affected user. For this purpose, the following new mail templates were added: `passwd-changed`, `passwd-invalidated` and `passwd-reset`.
- The Registration Server now supports sharing and synchronizing user profile information across all of the user's devices and with other users, e.g. initials, registration email, profile picture, full name, phone (telephone number), mobile (telephone number). Before, this information was shared with other users on a per-Space basis. Only users that share Spaces are able to exchange profile data with this new method. This feature will be supported by a future TeamDrive Client version.
- The expiry date of licenses is now properly checked via the "Expire Licenses" auto task. Users receive an advance notification 10 and 3 days before the license expires. When the date provided in the **Valid until** field has been reached, the user receives a final notification and his license will be reverted to the default free license. The following email templates were added to facilitate the notification: `license-expirein10days`, `license-expirein3days` and `license-expired-en`. To avoid disruptions/surprises when upgrading from previous Registration Server versions, the update function `setLicenseExpiryDefault()` will set the default value of `ENABLE_LICENSE_EXPIRY` to `False` for providers that already have licenses with an expiry date. When performing a new installation or adding a new provider account, license expiration will be enabled by default.
- Email templates now support the `[[BRAND]]` macro, to replace the term "TeamDrive" with another string if required. This can be defined via the `EMAIL/BRAND_NAME` provider setting. The default is `TeamDrive`.
- Most parts of the TeamDrive Registration Server installation can now be performed via RPM on Red Hat Enterprise Linux 6 and derivative distributions, which significantly improves the installation procedure and the process of applying updates. In particular, the following components are now provided in the form of RPM packages:
  - The PBT-based Registration Server (`td-regserver-3.6.8.0-0.el6.noarch.rpm`, files installed in `/usr/local/primebase/setup/scripts`)
  - The PHP-based Administration Console and support files (`td-regserver-adminconsole-3.6.8.0-0.el6.noarch.rpm`, files installed in `/var/www/html/adminconsole` and `/var/www/html/tdlibs`)
  - The Registration Server documentation in HTML format (`td-regserver-doc-html-3.6.8.0-0.el6.noarch.rpm`, files installed in the Apache server's document root `/var/www/html/td-regserver-doc/`, access to the documentation can be restricted by editing `/etc/httpd/conf.d/td-regserver-doc.conf`).

- The PrimeBase Application Environment (PrimeBase\_TD-4.5.48.<build>-0.el6.x86\_64.rpm installed in /usr/local/primebase), including the PrimeBase Apache module mod\_pbt (installed in /usr/lib64/httpd/modules/mod\_pbt.so) and some support scripts and configuration files in /etc/.
- The installation package now contains a script `mysql_install.sh` that performs the creation of the required `teamdrive` MySQL user account and populating the databases required for the Registration Server.
- The installation package now contains a log rotation script, to support rotation and compression of the Registration Server's log files.
- The installation now uses the default MySQL data directory location (`/var/lib/mysql`) instead of defining a custom one (`/regdb`). The default MySQL configuration settings for `my.cnf` have been reviewed and adjusted.
- The automatic service startup at bootup time is now configured using the distribution's `chkconfig` utility instead of changing the `Boot` options in file `/usr/local/primebase/pbstab`. The PrimeBase\_TD RPM package provides the required SysV init script `/etc/init.d/teamdrive` to facilitate this.
- The term “Distributor” has been replaced with “Provider” in most occasions.
- The obsolete settings `UseExternalAuthentication` and `UseExternalAuthenticationCall` have been removed. External authentication is now enabled by setting `AUTHSERVICE/USE_AUTH_SERVICE` to `True`.
- In previous versions, the setting `AUTH_VERIFY_PWD_FREQ` did not have any effect (it was added without the actual implementation by accident). Starting with version 3.0.018, a user's Clients will be logged out from the TeamDrive Service after the time defined in this setting. To avoid surprises and a change in behaviour after an upgrade, updating from a previous version of the Registration Server suggests calling the update function `setLoginFreqToZero()`; to change this setting to 0 for any existing Provider.

The PHP-based Administration Console received several new features, numerous usability enhancements and security improvements. Some notable highlights include:

- Tabular output (e.g. a filtered list of users, devices or licenses) can now be exported to CSV files.
- Tabular output now indicates the current sort order and column name with a small arrow icon.
- The columns visible in the table displayed on the **Manage Users** and **Manage Licences** pages are now configurable.
- The summary display of a user's licenses (“Licenses owned” and “Licenses used”) on the **Manage Users** page has been simplified.
- The list of Spaces in a user's Depot is now displayed as a sortable table.
- It's now possible to wipe or delete multiple devices of a user at once.
- The Registration Server's Authorization Sequence (required for exchanging invitations with users on other Registration Servers via TDNS) can now be obtained from the Administration Console via **Edit Settings -> RegServer -> AuthorizationSequence**.
- After successful registration, a Host Server's activation key is now displayed on the **Manage Servers** page, to simplify the registration process for new Host Servers.
- It is now possible to remove registered Host Servers via the **Manage Servers** page.
- The Administration Console now supports viewing a selection of server log files directly in the web browser instead of requiring logging in on the server's console. The **View Server Logs** page is only visible for the Registration Server's default provider and any user having the `HAS_VIEW_SERVER_LOGS_RIGHTS` privilege. The list of log files is defined in the (read-only) Reg Server setting `ServerLogFiles` and can only be modified by updating the setting in the database directly. Log files can only be viewed if the user that the Apache HTTP Server is running under (usually `apache`) has the required access privileges to view these files.

- Most of the Administration Console Settings are now stored in table `TD2Setting` of the MySQL database instead of the configuration file `tdlibs/globals.php` and can be configured via the Administration Console instead:
  - `LoginSecurity/LoginSessionTimeout` (default: 30)
  - `LoginSecurity/FailedLoginLog` (default: `/var/log/td-adminconsole-failedlogins.log`)
  - `LoginSecurity/LoginMaxAttempts` (default: 5)
  - `LoginSecurity/LoginMaxInterval` (default: 60)
  - `RegServer/ApiLogFile` (default: `/var/log/td-adminconsole-api.log`)
  - `RegServer/RegServerAPIURL` (previously known as `$regServerUrl`, not set by default)
  - `RegServer/ServerTimeZone` (default: `Europe/Berlin`)

The only information required in `globals.php` is the MySQL connection string to access the Registration Server's MySQL database. Alternatively, these credentials can be provided from a separate MySQL configuration file. See chapter Administration Console MySQL Configuration for details.

- Disabling a user does no longer provide the **apply to devices** option, as it's sufficient to disable the user account to block access to the TeamDrive service.
- A user's Space Depots on a Host Server can be activated/deactivated (added in 3.0.018.4, requires Host Server version 3.0.013.8 or later).
- The default provider can now set new passwords for other providers (added in 3.0.018.3).
- Changing the Provider setting `AUTHSERVICE/USE_AUTH_SERVICE` to `True` now automatically adds the other required settings like `AUTH_LOGIN_URL` and `VERIFY_AUTH_TOKEN_URL`.
- The provider filter selection list now also prints the company name after the 4-letter code.
- An option was added to assign an existing license to a user when editing the user's details.
- Various settings that used to expect values in bytes only now provide an option to select other units like "MB" or "GB".
- Input fields that expect a date now provide a date picker, to simplify the entering of dates.
- Filter options by date now provide a more intuitive way to define "before", "at" or "after" the entered date.

## 14.1 Change Log - Version 3.0.018

### 14.1.1 3.0.018.9 (YYYY-MM-DD)

- Administration Console: update copyright date (REGSERVER-915)
- Administration Console: fixed a session-handling issue related to parallel ajax requests (the result would usually be a "session variables not set" error in the adminconsole)

### 14.1.2 3.0.018.8 (2015-04-07)

- Administration Console: prevent editing of the `valid_until` license field for licenses that are not either in the `active` or `expired` phase, as this may cause problems with the `restricted` license feature. (REGSERVER-886)
- Administration Console: the `restricted` license feature flag will be sent to the API as `restricted` rather than `enterprise` (REGSERVER-869)
- Administration Console: Restricted licenses are marked with `(Restricted)` on the user overview and user details pages. (REGSERVER-877)

- Administration Console: Allow displaying and entering language codes longer than two characters on the user editing page. (REGSERVER-898)
- Administration Console: Fixed a bug that caused an incorrect count of a user's installations and invitations on the user overview page. (REGSERVER-901)
- Administration Console: Fixed a bug on the edit-user page that prevented editing accounts that had been flagged for deletion. (REGSERVER-902)
- Administration Console: The Administration Console will now send the affected user's provider code instead of the provider code of the user logged into the Administration Console when creating Depots and inviting other users to that Depot. (TRUS-61)
- API: The API now allows setting language codes as defined in [RFC 5646](#) (e.g. en\_US or de\_DE) which will be used by TD4 clients when registering a new user. (REGSERVER-898)
- Registration Server: Improved error logging: the output of several error messages (e.g. error codes -24916, -24919, -24909, -24913 or -24912) is now truncated and reduced to the relevant parts.

Error messages are now dumped in the following form:

```
03/16/2015 15:23:19 #1 ERROR: ERROR -24777: "reg_shared.pbt"@client line 183:
This is an error! [command=setparcels;device=377]
```

The Registration Server now reads out the log level defined in variable 342 of the `pbvm.env` configuration file so that it is used in code run by the PBT Apache module `mod_pbt` (previously, the log level was ignored by the PBT module). Valid log values are: 0=Off, 1=Errors, 2=Warnings, 3=Trace. (REGSERVER-859)

- Registration Server: When creating a new device, the device now receives the same license as all other devices, independent of the license's status. (REGSERVER-888)
- Documentation: Fixed link structure in the HTML documentation so that clicking **Next** and **Previous** works as expected (REGSERVER-908)
- Documentation: Removed the chapter that describes the MySQL databases and tables that will be installed from the Reference Guide. (REGSERVER-899)

### 14.1.3 3.0.018.7 (2015-03-05)

- Administration Console: Added support for setting the `restricted` feature flag on licenses (previously labeled `enterprise`).
- Administration console: Updated list of template types viewed in the mail queue view. (REGSERVER-841)
- Administration console: Updated misleading text when viewing device messages from users located on another server. (REGSERVER-839)
- Registration Server: Fixed that `ProfileDataExchangeEnabled` was not checked when changing a user's email address and the Registration Server database schema has not been converted to the 3.0.018 schema. (REGSERVER-849)
- API: Fixed that `UserEmailUnique` was not enforced when registering users via the API. (REGSERVER-730)
- API: Added support for setting the "Restricted" license flag, which can be used to disable/limit certain TD 4 Client functionality. Previously, this feature flag was labeled "Enterprise", but it was not actively used. (REGSERVER-867)
- Registration Server: Added missing provider setting `REDIRECT/REDIRECT_HOME` that sets the provider's home page URL used in the user's start menu. (REGSERVER-851)
- Registration Server: fixed mail template fallback code to fall back to the English templates as a last resort, if a default template in the provider's default language is not available. (REGSERVER-858)
- Documentation: Updated API chapter and replaced the incorrect statement that the temporary password generated by the "sendpassword" API call expires after a time period of 10 minutes with a notice that a

generated temporary password remains active and unchanged until the user's password will be changed. (REGSERVER-870)

### 14.1.4 3.0.018.6 (2015-02-19)

- Installation: To simplify the configuration for new deployments, the default license issued to Clients is now a Professional license including WebDAV support (the value of CLIENT/DEFAULT\_FREE\_FEATURE was changed from 3 to 10). This change only affects new Registration Server installations, the setting remains unchanged when updating existing installations. (REGSERVER-821)
- Installation: Updated `mysql_install.sh` to re-create InnoDB log files after changing `innodb_log_file_size` in `my.cnf`. (REGSERVER-847)
- Installation: fixed bug in the `setLicenseExpiryDefault()` upgrade routine which inserted incorrect entries into the `td2reg.TD2OwnerMeta` table for existing licenses having a non-NULL value in the `ValidUntil` column. (REGSERVER-848)

If you have have performed an upgrade from a previous Registration Server version to version 3.0.018 before (which included calling `setLicenseExpiryDefault()`) **and** you have issued licenses with an expiry date, please perform the following steps to remove the incorrect entries. Start the MySQL client `mysql` as user `teamdrive` and enter the following command to delete the entries:

```
mysql> DELETE FROM td2reg.TD2OwnerMeta \
-> WHERE Name="ENABLE_LICENSE_EXPIRY" AND \
-> OwnerID NOT IN (SELECT DISTINCT ID FROM td2reg.TD2Owner);
```

Afterwards, verify the setting `ENABLE_LICENSE_EXPIRY` for all Providers hosted on your Registration Server and only set it to `True` when this provider intends to issue licenses with an expiry date.

Note that while it was possible to create licenses with an expiry date in previous versions, the Registration Server did not actually check this date prior to version 3.0.018. To avoid an unexpected expiry of existing licenses after upgrading to version 3.0.018, the upgrade function `setLicenseExpiryDefault()` checks all existing licenses during an upgrade and sets the Provider setting `ENABLE_LICENSE_EXPIRY` to `False` for the respective Provider.

- Administration Console: Added missing `<distributor>` field to the `cancellicense` and `resetpassword` API calls that prevented the default provider from deleting licenses or resetting the user passwords for other providers hosted on the same Registration Server. (REGSERVER-827)
- Administration Console: Fixed bug where **View mail queue** did not show all queued email messages (outgoing invitation emails to unregistered users were not displayed). (REGSERVER-818)
- Administration Console: when importing email templates from the file system into the database, line endings are now automatically converted to be properly terminated with CRLF (`\r\n`)
- Admin Console: Fixed error message API error code: `-30100,message: User name not provided` when deleting a user's default Depot (the Depot was still deleted as requested). (REGSERVER-835)
- Administration Console: updated the regular expression that checks for valid URLs in the the `LogUploadURL` field to accept URLs beginning with `https` as well. (REGSERVER-837)

Note that this change is not applied automatically to the configuration table during an update. For existing installations, you need to update the field `Format` in table `td2reg.TD2Setting` for this setting as follows, if you want to change the URL via the Administration Console:

```
mysql> UPDATE td2reg.TD2Setting \
SET Format="^(http|https)://[a-zA-Z0-9-\./+/-.$" \
WHERE NAME="LogUploadURL";
```

- Administration Console: Fixed bug that prevented users logged into the Admin Console with their “magic username” to set their password. Also improved session handling to not drop the session when a user logged into the Admin Console changes his own password (which invalidated the existing session before).

- API: The call `getUserdata` failed with `User does not exist`, if `USE_EMAIL_AS_REFERENCE` was set to `True` and the email address was used as the user name. (REGSERVER-824)
- Registration Server: When using external authentication, TD4 Clients could sometimes receive spurious logout events, requiring the user to log in again. Please note that this bug fix may cause Clients that use external authentication to logout again *once* after the upgrade. After that, such apparently random log-outs should no longer occur. (REGSERVER-820)
- Registration Server: Fixed wrong path in the fallback routine that is supposed to use the default mail template for templates missing from a provider's template folder. (REGSERVER-842)
- Registration Server: Fixed bug that caused file comment notification emails to include the recipient's email address in the From:-Header instead of the sender's email address. (REGSERVER-843)
- Registration Server: When changing `HAS_DEFAULT_DEPOT` from `True` to `False`, a user's devices no longer offered a user's already existing default depot for creating Spaces. (REGSERVER-834)
- Registration Server: Outgoing email messages (e.g. Space invitations) could violate **RFC 5321**, if templates did not use the appropriate line termination character sequence (CRLF, `\r\n`). Now, all outgoing email messages are reformatted before submission to the MTA. (REGSERVER-833)
- Registration Server: Fixed bug that prevented users from logging in with their user name in different capitalization if `UserNameCaseInsensitive` was set to `True` (which is the default) (REGSERVER-823)
- Registration Server: Shortened the temporary password that gets generated and mailed to a user when a user's password needs to be changed (e.g. via the "Forgotten Password" option in the Client or via the `sendpassword` API call. Previously, the temporary password consisted of a random MD5 string (32 characters), that turned out to be difficult to handle (e.g. on mobile devices). It now returns a combination of the characters 0-9, a-z and A-Z (excluding 0, O, l and 1, which can be misread). The length of the temporary password now depends on the Client version: 2.x → 32 characters (unchanged), 3.x → 8 characters, 4.x → 5 characters. The 3.x and 4.x Clients have been changed to accept 4 or more characters, the API uses the version of the most recently used device. (REGSERVER-831)
- `upload.php`: Improved security of the PHP script that accepts Client debug log uploads (e.g. to prevent potential XSS attacks), removed absolute path name from the generated upload status file. Note: this script is not included in the RPM distribution and is not installed by default. (REGSERVER-836)

### 14.1.5 3.0.018.5 (2015-01-23)

- Registration Server: Fixed Space invitation emails to existing users that contained the recipient as the sender in the mail header. (REGSERVER-817)
- Installation: added a new RPM package `td-regserver-doc-html` that contains the Registration Server documentation in HTML format, installed in the Registration Server's Apache document root `/var/www/html/td-regserver-doc/`. Access to the documentation can be restricted by editing `/etc/httpd/conf.d/td-regserver-doc.conf`. (REGSERVER-816)
- Registration Server: disabled banner support for legacy TD 2.x clients

### 14.1.6 3.0.018.4 (2015-01-13)

- Administration Console: Improved reporting of HTTP errors during API requests. (REGSERVER-798)
- Administration Console: Fixed API error changing a user's email address if the user name contained UTF-8 characters. (REGSERVER-775)
- Administration Console: fixed support for activating/deactivating Space Depots. (REGSERVER-810) This requires Host Server version 3.0.013.8 or later.

### **14.1.7 3.0.018.3 (2014-12-17)**

- Administration Console: fixed incorrect hex encoding of email templates when initially importing them from the file system into the database. (REGSERVER-806)
- Administration Console: added new Reg Server setting `RegServer/RegServerAPIURL` for setting a custom URL to issue Reg Server API requests (e.g. in case of a dedicated API server or if https should be used for API requests). If not set, the API URL will be derived from the `RegServerURL` setting (REGSERVER-799).
- Administration Console: The default provider can now set new passwords for other providers (REGSERVER-768).
- Installation: removed `<APIChecksumSalt>` from `RegServerSetup.xml` and updated the installation instructions accordingly, to simplify the installation process (this value is generated by `RegServerSetup.pbt` automatically during the initial installation).
- Installation: updated installation instructions and VM installation script to install the `php-mbstring` package (required for the email template import into the database). (REGSERVER-802)
- Installation: updated installation instructions and VM installation script to set `date.timezone` in `/etc/php.ini`, to avoid frequent PHP warning messages when using the CSV import cron job. (REGSERVER-801)
- Installation: the RPM now automatically re-creates the file `StartupCache.pbt` and calls `HTTPRequest.pbt` during an upgrade (e.g. to add new Reg Server settings) (REGSERVER-800)
- Installation: added `max_allowed_packet=2M` to the MySQL configuration file `my.cnf`, to support uploading User Profile information containing profile pictures. In order to support this feature, the `PrimeBase_TD` package also needs to be updated to version 4548.120 or newer (TDCLIENT-1663).
- Installation: changed `MaxRequestsPerChild` in `httpd.conf` from 0 to 10000, to ensure Apache child processes are restarted from time to time (REGSERVER-762)
- Registration Server: Fixed that `SETTING_TDNS_PROXY_URL` gets overwritten by the `SETTING_HOST_PROXY_URL` setting (in case accessing TDNS requires using a different proxy server than accessing the Host Server (REGSERVER-769).

### **14.1.8 3.0.018.2 (2014-11-12)**

- Fixed bug in propagating email address changes to other devices belonging to a user
- Fixed bug in deleting a user's privileges when deleting the user's account (REGSERVER-734)
- Fixed issue with store forward messages that were not forwarded to a user upon registration (REGSERVER-759)
- Administration Console: Fixed encoding issue when adding users with usernames containing UTF-8 characters (REGSERVER-756)
- Administration Console: Fixed minor bug in the "Add new provider settings" menu (REGSERVER-747)
- `RegServerSetup.xml`: Fixed missing closing bracket in the `APIChecksumSalt` tag.
- API: fixed `addXMLDepot` call that returned invalid URLs when the setting `SIMULATE_REGSERVER_20` was enabled. (REGSERVER-741)

### **14.1.9 3.0.018.1 (2014-11-05)**

- Initial public release

## RELEASE NOTES - VERSION 3.0.017

Table 15.1: Release Notes - Version 3.0.017

Build Date	Version	Comment
2014-09-02	30017.13	<ul style="list-style-type: none"> <li>• Admin Console: show extreference in the license Administration screen</li> <li>• Security improvement: fixed OS permissions/ownerships of some configuration files and log files containing plaintext passwords (REGSERVER-599)</li> <li>• Admin Console: Security improvement: Don't display the Console version on the login page (REGSERVER-558)</li> <li>• Virtual Appliance: set <code>ServerTokens</code> to <code>Prod</code> and <code>ServerSignature</code> to <code>Off</code> in <code>httpd.conf</code>, to disable displaying the Apache HTTP Server version and OS version in the HTTP headers and on error pages (REGSERVER-608)</li> <li>• Added missing tag <code>&lt;APISendEmail&gt;</code> in <code>DIST.xml</code> template file</li> <li>• Security improvement: disabled unneeded HTTP methods in <code>pbt.conf</code> (only allow GET, POST, disable PUT, HEAD, OPTIONS, TRACE) (REGSERVER-613)</li> <li>• API: added new API call <code>removedepotfromuser</code> extended <code>setdepotforuser</code>. Fixed bug in <code>setreference</code> and removed deprecated <code>location-Support</code> in <code>getHostForDistributor</code>. Fixed error handling in <code>setinviteduser</code>. Updated API-Version number to "1.0.005".</li> <li>• For monitoring purposes, calling the Reg Server's ping URL with the optional parameter <code>tdns=\$true` (e.g. <code>http://regserver.yourdomain.com/pbas/td2as/reg/ping.xml?tdns=\$true`</code> now also performs a TDNS lookup, to verify that the communication between the Reg Server and TDNS is working properly.</code></li> </ul>

Table 15.1 – continued from previous page

Build Date	Version	Comment
2014-07-09	30017.12	<ul style="list-style-type: none"> <li>• Updated to requiring PrimeBase 4.5.48, updated pbstab and documentation accordingly. This version of PrimeBase now installs a shell profile file by default and provides a proper SysV init script that can be used to enable/disable the pbac_mailer background task.</li> <li>• Admin Console: Fixed wrong escaping of HTML characters in the device messages popup (REGSERVER-575)</li> <li>• Admin Console: changed session timeout from 10m to 30m</li> <li>• Admin Console: Added more fields to license editing page</li> <li>• RegServerSetup.pbt now sets APIAllowSettingDistributor to true if another distributor is added (REGSERVER-579)</li> <li>• Added missing globalDepotID to default depots for clients with two accounts on the same server(s). (REGSERVER-583) (this fix also requires an updated Host Server having the fix from HOSTSERVER-326)</li> </ul>
2014-06-26	30017.11	<ul style="list-style-type: none"> <li>• Admin Console: “Create Depot” now accepts storage limits in other units than bytes. Unified the UI with regards to selecting a Depot owner and selecting Users to invite (REGSERVER-574)</li> </ul>
2014-06-17	30017.10	<ul style="list-style-type: none"> <li>• Admin Console: Added confirmation checkbox for deleting a user’s license when deleting the user (REGSERVER-554)</li> <li>• Admin Console: Improved listing of licenses to no longer show one entry per Device for the same license (REGSERVER-565)</li> <li>• Admin Console: Replaced “parcel” with “key repository”, replaced “Packet” with “Package” in the License creation/editing dialogues (REGSERVER-567)</li> <li>• Admin Console: Added exporting tables as CSV function.</li> <li>• Fixed missing LOG_UPLOADS setting in upload.php log upload script (REGSERVER-559)</li> <li>• Added Proxy support in upgradeDefaultDepot</li> <li>• Major documentation rewrite: added general reference and API documentation, converted all documents to reStructured-Text/Sphinx</li> <li>• RegServerSetup.xml: Fixed incorrect closing tag (&lt;/ProviderInfoURL&gt; -&gt; &lt;/DownloadURL&gt;)</li> </ul>
2014-04-17	30017.9	<ul style="list-style-type: none"> <li>• Removed misleading error output in csvimportregserver.php</li> <li>• Fixed default license key error using the API (REGSERVER-526)</li> <li>• Improved description for StoreRegistrationDeviceIPinSeconds (REGSERVER-532)</li> <li>• Admin Console: bugfix for editUser.php: wrong user got displayed when changing depot limits.</li> <li>• Admin Console: editUser.php didn’t display “extauthid” in all cases (REGSERVER-537)</li> <li>• Admin Console: Display activation code in device-list entry for deactivated tdhosting “users”</li> </ul>

Table 15.1 – continued from previous page

Build Date	Version	Comment
2014-03-27	30017.8	<ul style="list-style-type: none"> <li>• Admin Console: server/distributor settings can now be empty strings (REGSERVER-476)</li> <li>• Admin Console: displays a warning if LOGIN_IP is not set</li> <li>• REGSERVER-464: RegServerSetup.pbt now prints the Authentication Sequence during initial install</li> <li>• REGSERVER-494: Sending notification to users located on different Reg-Server returned “remote authorization not allowed”</li> <li>• Improved error handling in case of empty hosting_url or hosting_name</li> <li>• REGSERVER-507: Don’t create user accounts in p1reg.sql</li> <li>• RegServerSetup.pbt: Improved screen output for readability and clarity</li> <li>• RegServerSetup.xml: Default for &lt;TDNSEnabled&gt; must be \$true to avoid errors for a default setup</li> <li>• CSV_IMPORT_ACTIVE should not add CSV_UPLOAD_DIR, CSV_ERROR_DIR and CSV_SUCCESS_DIR, because we support import using the database or a hot folder. Default is using the database and therefore the Dir-Settings are not required.</li> <li>• Packaging: Updated and added DIST.xml to the distribution</li> <li>• Fixed link in bannerAdmin.php</li> <li>• Removed duplicate code in RegServerSetup.pbt</li> </ul>
2014-03-14	30017.7	<ul style="list-style-type: none"> <li>• Fixed nasty typo in RegServerSetup.xml</li> </ul>
2014-03-14	30017.6	<ul style="list-style-type: none"> <li>• REGSERVER-478: Deleting TD2FreeUserStorage and TD2Parcel in case of deleting a user</li> <li>• reg_init.pbt: Now only use the curl-based code to verify external logins (both via http and https)</li> <li>• External auth: Updated LDAP ext auth example: implement function base64url to encode the token, to avoid “+” and “/” being included in the token string.</li> <li>• REGSERVER-471: Admin Console XSS security fixes related to TD2User</li> <li>• External auth: fixed REGSERVER-443 (Sample login page defaults to “Password lost”, not “Login”), changed error messages to show the same error regardless if user name or password are wrong.</li> <li>• Admin Console: moved failed-logins log file to /var/log/td-adminconsole-failedlogins.log. NOTE: this log file must now be created during installation</li> </ul>
2014-02-25	30017.5	<ul style="list-style-type: none"> <li>• Updated pbstab version number from 4546 to 4547</li> <li>• Added deleteDistributor to RegServerSetup.pbt</li> <li>• Executing HTTPRequest.pbt in RegServerSetup.pbt requires no location</li> <li>• RegServerSetup.pbt: Generate a mysql update script if changes are required to the database structure</li> <li>• Handle the case that the TD2Setting.Format column does not exist, when creating system variables</li> </ul>

Table 15.1 – continued from previous page

Build Date	Version	Comment
2014-02-07	30017.4	<ul style="list-style-type: none"> <li>• REGSERVER-426: Admin Console: changed API log file location to /var/log/td-adminconsole-api.log</li> <li>• Admin Console: added option to edit a depots transfer limit</li> <li>• REGSERVER-428: Removed duplicate entry &lt;UserEmailUnique&gt; from section &lt;RegServer&gt; in RegServerSetup.xml and RegServerSetup.pbt</li> <li>• Admin Console: improved test to check if the setDepot function is available on a host server</li> <li>• Install upload.php into logupload/upload.php instead the document root</li> <li>• Admin: user simply gets a warning when trying to call setdepot on a host server that does not support it</li> <li>• pbt.conf: Reduced mod_pbt log level from 2 (PBT_TRACE) to 1 (ERROR_TRACE) to reduce default log noise in /tmp/pbt_mod.trace</li> <li>• Admin: fixed regex that prevented changing the LogUploadURL setting</li> <li>• REGSERVER-432: API call upgradelicense no longer throws an error if feature is empty</li> <li>• Admin Console: the API log now correctly shows entries that don't have usernames</li> <li>• REGSERVER-436: Setting HAS_DEFAULT_DEPOT to true, creates all missing hosting system parameters</li> </ul>
2014-02-04	30017.3	<ul style="list-style-type: none"> <li>• Bug fixes: REGSERVER-424, double &lt;teamdrive&gt; tag removed, fixed invitations when a user was registered with same e-mail on 2 other Reg Servers, Added Download-URL for invitation mail templates</li> </ul>
2014-01-30	30017.2	<ul style="list-style-type: none"> <li>• Renamed out.log to api.log</li> <li>• Fixed RegEx for API_IP_ACCESS</li> <li>• Admin Console: Changed default mysql username to teamdrive</li> <li>• Updated pbvm.env to write the log file into /var/log/pbvm.log (REGSERVER-423)</li> <li>• REGSERVER-422: changed the default log file location in pbstab for the pbac_mailer from /tmp/mail.log to /var/log/pbac_mailer.log</li> <li>• Removed setup/pbas.env from the installation package</li> </ul>
2014-01-23	30017.1	<ul style="list-style-type: none"> <li>• First build using the scripted build, updated RegServerSetup.pbt and included some Admin Console fixes</li> </ul>
2013-10-23	30017	<ul style="list-style-type: none"> <li>• Not final; Bcrypt is still missing</li> </ul>

## 16.1 Glossary

**Client** The software application used by users to interact with the TeamDrive system. Can be customized to various degrees. Every device requires a Client application.

**Device** A computer used by a user to access the TeamDrive system.

**Installation** Simply refers to the installation of the client application on a device.

**User** A person using the TeamDrive System.

**Provider (aka Distributor or Tenant)** The “owner” of some set of Users. See provider concept for a detailed explanation.

**Space** A virtual folder containing data that can be shared with other TeamDrive users. This is what TeamDrive is all about.

## 16.2 Abbreviations

**PBAC** Prime Base Automation Client

**PBAS** Prime Base Application Server

**PBEE** Prime Base Environment Editor

**PBCON** Prime Base Console

**PBT** Prime Base Talk

**SAKH** Server Access Key HTTP for TeamDrive 2.0 Clients

**TDES** Team Drive Enterprise Server

**TDNS** Team Drive Name Service

**TDPS** Team Drive Personal Server

**TDRS** Team Drive Registration Server

**TDSV** Same as **SAKH**, but for TeamDrive 3.0 Clients: Team Drive Server
